Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 1 (1%), Referenced to phase 2:NBTL and 6:SBTL, Start of Green

Natural Cycle: 105

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.77

Intersection Signal Delay: 26.6

Intersection LOS: C

Intersection Capacity Utilization 59.6%

ICU Level of Service B

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Lanes, Volumes, Timings 14: Randolph Avenue & Driveway/Brea Mall

Existing
 Sat MD Peak Hour

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 14: Randolph Avenue & Driveway/Brea Mall

Lanes, Volumes, Timings
15: Brea Mall South & State College Boulevard

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 28 (23%), Referenced to phase 4:EBT and 8:WBT, Start of Yellow

Natural Cycle: 115

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 2.05

Intersection Signal Delay: 121.4

Intersection LOS: F

Intersection Capacity Utilization 94.0%

ICU Level of Service F

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Lanes, Volumes, Timings 20: State College Boulevard & Imperial Highway

Existing
Sat MD Peak Hour

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 20: State College Boulevard & Imperial Highway

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 110 (92%), Referenced to phase 4:EBT and 8:WBT, Start of Yellow

Natural Cycle: 105

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.99

Intersection Signal Delay: 28.9

Intersection LOS: C

Intersection Capacity Utilization 68.8%

ICU Level of Service C

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Lanes, Volumes, Timings 20: State College Boulevard & Imperial Highway

Existing Plus Project
 AM Peak Hour

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 20: State College Boulevard & Imperial Highway

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 28 (23%), Referenced to phase 4:EBT and 8:WBT, Start of Yellow

Natural Cycle: 115

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 2.42

Intersection Signal Delay: 146.1

Intersection LOS: F

Intersection Capacity Utilization 98.9%

ICU Level of Service F

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Lanes, Volumes, Timings 20: State College Boulevard & Imperial Highway

Existing Plus Project
Sat MD Peak Hour

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 20: State College Boulevard & Imperial Highway

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 0 (0%), Referenced to phase 4:EBT and 8:WBT, Start of Yellow

Natural Cycle: 115

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.11

Intersection Signal Delay: 69.6

Intersection LOS: E

Intersection Capacity Utilization 84.4%

ICU Level of Service E

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Lanes, Volumes, Timings 20: State College Boulevard & Imperial Highway

Existing Plus Project [MIT]
 PM Peak Hour

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 36 (30%), Referenced to phase 4:EBT and 8:WBT, Start of Yellow

Natural Cycle: 115

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.80

Intersection Signal Delay: 87.4

Intersection LOS: F

Intersection Capacity Utilization 93.5%

ICU Level of Service F

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Lanes, Volumes, Timings

20: State College Boulevard & Imperial Highway

Year 2022
PM Peak Hour

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 20: State College Boulevard & Imperial Highway

Lanes, Volumes, Timings
14: Randolph Avenue & Driveway/Brea Mall

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 28 (23%), Referenced to phase 4:EBT and 8:WBT, Start of Green

Natural Cycle: 105

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.92

Intersection Signal Delay: 38.0

Intersection LOS: D

Intersection Capacity Utilization 61.3%

ICU Level of Service B

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 36 (30%), Referenced to phase 4:EBT and 8:WBT, Start of Yellow

Natural Cycle: 115

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.97

Intersection Signal Delay: 94.9

Intersection LOS: F

Intersection Capacity Utilization 96.9%

ICU Level of Service F

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Lanes, Volumes, Timings 20: State College Boulevard & Imperial Highway

Year 2022 Plus Project
PM Peak Hour

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 20: State College Boulevard & Imperial Highway

Lanes, Volumes, Timings
14: Randolph Avenue & Driveway/Brea Mall

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 5 (4%), Referenced to phase 4:EBT and 8:WBT, Start of Yellow

Natural Cycle: 105

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.01

Intersection Signal Delay: 37.3

Intersection LOS: D

Intersection Capacity Utilization 71.3%

ICU Level of Service C

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Lanes, Volumes, Timings 20: State College Boulevard & Imperial Highway

Year 2022 Plus Project [MIT]
AM Peak Hour

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 20: State College Boulevard & Imperial Highway

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 111 (93%), Referenced to phase 2:EBT and 6:WBT, Start of Yellow

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.95

Intersection Signal Delay: 38.3

Intersection LOS: D

Intersection Capacity Utilization 83.6%

ICU Level of Service E

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 54 (45%), Referenced to phase 4:EBT and 8:WBT, Start of Yellow

Natural Cycle: 80

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.94

Intersection Signal Delay: 39.7

Intersection LOS: D

Intersection Capacity Utilization 73.6%

ICU Level of Service D

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 22: SR-57 NB Off-Ramp/Shopping Center Dwy & Imperial Highway

Intersection Summary

Area Type: Other
Cycle Length: 120
Actuated Cycle Length: 120
Offset: 20 (17%), Referenced to phase 4:EBT and 8:WBT, Start of Yellow
Natural Cycle: 75
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.90
Intersection Signal Delay: 18.2
Intersection Capacity Utilization 129.0%
Analysis Period (min) 15
95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 21: Imperial Highway & SR-57 SB Off-Ramp

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 31 (26%), Referenced to phase 2:EBT and 6:WBT, Start of Yellow

Natural Cycle: 80

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.92

Intersection Signal Delay: 32.9

Intersection LOS: C

Intersection Capacity Utilization 88.8%

ICU Level of Service E

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Intersection Summary

Area Type: Other

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 57 (48%), Referenced to phase 4:EBT and 8:WBT, Start of Yellow

Natural Cycle: 80

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.90

Intersection Signal Delay: 36.8

Intersection LOS: D

Intersection Capacity Utilization 82.4%

ICU Level of Service E

Analysis Period (min) 15

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 22: SR-57 NB Off-Ramp/Shopping Center Dwy & Imperial Highway

4: SR-57 SB On-Ramp/SR-57 SB Off-Ramp & Lambert Road

Intersection Summary

Area Type: Other

Cycle Length: 36

Actuated Cycle Length: 36

Offset: 24 (67%), Referenced to phase 4:EBT and 8:WBT, Start of Yellow

Natural Cycle: 80

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.69

Intersection Signal Delay: 79.5

Intersection LOS: E

Intersection Capacity Utilization 135.4%

ICU Level of Service H

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

- # 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Appendices

Appendix J: Tribal Consultation Correspondence

Appendices

This page intentionally left blank.

1. The results of any record search that may have been conducted at an Information Center of the California Historical Resources Information System (CHRIS), including, but not limited to:
 - A listing of any and all known cultural resources have already been recorded on or adjacent to the APE, such as known archaeological sites;
 - Copies of any and all cultural resource records and study reports that may have been provided by the Information Center as part of the records search response;
 - Whether the records search indicates a low, moderate or high probability that unrecorded cultural resources are located in the APE; and
 - If a survey is recommended by the Information Center to determine whether previously unrecorded cultural resources are present.
2. The results of any archaeological inventory survey that was conducted, including:
 - Any report that may contain site forms, site significance, and suggested mitigation measures.

All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum, and not be made available for public disclosure in accordance with Government Code Section 6254.10.
3. The result of the Sacred Lands File (SFL) check conducted through the NAHC was negative.
4. Any ethnographic studies conducted for any area including all or part of the APE; and
5. Any geotechnical reports regarding all or part of the APE.

Lead agencies should be aware that records maintained by the NAHC and CHRIS is not exhaustive, and a negative response to these searches does not preclude the existence of a tribal cultural resource. A tribe may be the only source of information regarding the existence of a tribal cultural resource.

This information will aid tribes in determining whether to request formal consultation. In the event, that they do, having the information beforehand will help to facilitate the consultation process.

If you receive notification of change of addresses and phone numbers from tribes, please notify the NAHC. With your assistance, we can assure that our consultation list remains current.

If you have any questions, please contact me at my email address: steven.quinn@nahc.ca.gov.

Sincerely,

Steven Quinn
Associate Governmental Program Analyst

GABRIELENO BAND OF MISSION INDIANS - KIZH NATION

Historically known as The San Gabriel Band of Mission Indians
recognized by the State of California as the aboriginal tribe of the Los Angeles basin

Project Name: Brea Mall Mixed Use Project City of Brea , Orange County CA

Dear Jessica,

Thank you for your letter dated August 16,2019 regarding AB52 consultation. The above proposed project location is within our Ancestral Tribal Territory; therefore, our Tribal Government requests to schedule a consultation with you as the lead agency, to discuss the project and the surrounding location in further detail .

Please contact us at your earliest convenience. ***Please Note :AB 52, “consultation” shall have the same meaning as provided in SB 18 (Govt. Code Section 65352.4).***

Thank you for your time,

Andrew Salas, Chairman
Gabrieleno Band of Mission Indians – Kizh Nation
1(844)390-0787

Andrew Salas, Chairman

Albert Perez, treasurer I

Nadine Salas, Vice-Chairman

Martha Gonzalez Lemos, treasurer II

GABRIELINO- TONGVA TRIBE

A California Indian Tribe historically known as San Gabriel Band of Mission Indians

TRIBAL CULTURAL RESOURCES AB52/SECTION 106 CONSULTATION
GABRIELINO TONGVA TRIB

Linda Candelaria
Co-Chairwoman Gabrielino Tongva Tribe

October 6, 2019

Attention:
Planning Division
City of Brea

This letter is to inform the City of Brea that the Gabrielino Tongva Tribe will be actively participating in the tribal consultation process. Our cultural resource representative will be Sam Dunlap (Email: TongvaTCR@gmail.com, Mobile: (909) 262-9351). The Gabrielino Tongva Tribe has authorized Sam Dunlap to act on our behalf in the government to government consultation process.

The Gabrielino Tongva Tribe would like to express our ongoing concerns with the AB52/Section 106 consultation process that the Gabrielino Tongva Tribe has encountered over the last few years. The Gabrielino Tongva Tribe has ancestral ties and cultural affiliation to the city's jurisdictional area. We therefore have a vested interest in the AB52 and Section 106 consultation process with the City of Brea.

The City of Brea should be aware that the State of California's Native American Heritage Commission (NAHC) maintains a list of culturally affiliated Gabrielino Tongva Tribes for your area for a reason. It has been our experience as one of the designated Gabrielino Tongva Tribes that several cities within our tribal territory have been misled into believing that one particular Gabrielino tribe has sole jurisdiction over another. This particular issue is being carried out by a recently formed (2008) tribal group that has managed to abuse the AB52 process for their own benefit.

The AB52/Section 106 consultation process enables our Tribe to have an equal opportunity in future mitigation measures that the City of Brea may implement that affect Tribal Cultural Resources (TCR's), the Tribe would prefer to see language that enables our presence on site during ground disturbance/excavation activity so that we may identify and assess the significance of any Tribal Cultural resource that may be encountered.

The Gabrielino Tongva Tribe looks forward to cooperating with the City of Brea as an equal partner in determining a rational approach to environmental compliance and establishing a fair and equal protocol for our tribal participation.

Sincerely,

Linda Candelaria
Co-Chairwoman
Gabrielino Tongva Tribe

Linda Candelaria, Councilwoman
Jerry Maldonado, Councilman

Vincent Holguin, Councilman
Charles Alvarez, Councilman
Jane Hussey, Councilwoman

**MEMORANDUM TO FILE
PLANNING DIVISION**

1 Civic Center Circle
Brea, CA 92821
(714) 671.4462

TO: FILE for Brea Mall Mixed Use Project
FROM: Jessica Magaña, Associate Planner
DATE: October 10, 2019
RE: GABRIELENO BAND OF MISSION INDIANS – KIZH NATION

A conference call was conducted on October 10, 2019 at 11:00 am with Matt Teutimez and Andrew Salas of the Gabrieleno Bands of Mission Indians – Kizh Nation, with City Planning representatives Maribeth Tinio and Jessica Magaña.

Mr. Teutimez and Mr. Salas stated that the Brea area is within their ancestral territory. Regarding the project site, they inquired about development history at the Brea Mall and told us the site may have tribal culture resources because its proximity to Imperial Highway, which was a route for travel and an important trade corridor. They stated that burial sites were often along travel corridors and trade routes. They stated the desire to protect cultural resources and find artifacts which may be buried.

They indicated they would like to obtain any soil reports that may have been previously conducted for the site and would like to review future soil reports to determine the current soil conditions and potential disturbances on the site. If limited information is provided in the soil reports they would like to provide recommended mitigation language for the City to consider.

The City said that they would provide them with any soil reports on file and would work with them to review appropriate mitigation, if any. The City thanked them for the information and said we will keep the tribe updated on the project.

Tab 1: Overview & Site-Specific Information***1.1 Overview***

The City of Brea (City) currently serves a population of approximately 41,000 people within a 12 square mile area. The City's wastewater collection system is managed by the City's Street, Sewer, Storm Drain & Sanitation Division. The collection system consists of about 119 miles of gravity sewer lines and three pump (lift) stations. Flows from these local sewers discharge into Orange County Sanitation District facilities for treatment and disposal.

City personnel provide engineering evaluation of proposed and existing sewer facilities, administer the City's sewer service charge ordinance, carry out annexation proceedings for new service areas, form and dissolve service zones, maintain facility record plans and administer preventive maintenance and sewer construction programs. Since the City is responsible for properly managing, operating, and maintaining all portions of their wastewater collection system, as well as providing adequate capacity to carry peak capacity flows, sewer flow monitoring is required as a condition of development whenever a project proposes to construct 10 or more residential dwelling units or add 10,000 square feet (sf) or more of commercial space. This requirement not only helps to ensure adequate capacity, but continually updates their databases with the most current information, allowing the City to improve the condition and performance of its wastewater collection system, reducing the occurrences of SSOs, and ensuring the health and safety of the community.

1.2 Project Description

Utility Systems Science & Software, Inc. (US³) was contracted by raSmith to perform sewer flow monitoring at five sewer manholes for a period of seven days for their Brea Mall Mixed Use Project. Two sewer monitoring sites within Brea Mall were selected for concurrent monitoring with three downstream manholes. This sewer system assessment was developed under conditions existing between 09/24/2019 and 10/10/2019 to analyze for potential capacity limitations in the monitored lines, which includes the anticipated effects of redeveloping the property at 1065 Brea Mall in Brea.

The Brea Mall encompasses approximately 74 acres in northeast Orange County. The Mall is west of State Route 57 (SR-57) and is generally bounded by State College Boulevard to the east, Imperial Highway (SR 91) to the south, S. Randolph Av to the west, the City of Brea City Hall and Embassy Suites by Hilton to the northwest, and E. Birch St to the north. The project site is generally in the southwest portion of the Brea Mall, in the area formerly occupied by Sears.

US³ assessed permitting and traffic control requirements for the selected monitoring sites. Site-specific diagrams from the California Work Area Traffic Control Handbook (CA WATCH) were prepared for submittal with the City Encroachment Permit applications, which fully conformed with the California Manual of Uniform Traffic Control Devices. Due to the distance between the monitoring locations, two encroachment permits were approved by the City prior to flow monitoring.

US³ performed site inspections to evaluate the site hydraulics at the selected monitoring sites as part of the installation process. **Note:** Each wastewater collection system is different, and some of the differences that affect flow monitoring include: slope of sewer line; age, condition and material of sewer line; number and type of connections; and sewer design, specifically the proximity of baffles, drop structures, pumps, siphons, and weirs. Only one of these structures was noted during the initial installations, which was a drop inlet, but since no flow was observed discharging from the drop inlet, it was deemed acceptable for flow monitoring during the inspection. Therefore, the initial installations occurred on 09/24/2019 at the Nordstrom MH and at Sites 1, 2, 3 and 4.

Upon review of the field installation documents and photos, it was determined that what were assumed to be the locations of Sites 3 and 4 were actually Site 3A (most likely a brine line) and Site 3. Therefore, installation at the correct Site 4 MH occurred on 10/02/2019. It was then determined that an upstream manhole should be monitored concurrently as was done during the initial monitoring. Therefore, installation at the Site 1 Upstream (US) MH occurred on 10/04/2019. Monitoring at the Site 4 MH and the Site 1 US MH is also referred to as the second week of monitoring or secondary monitoring. The monitoring site locations and sewer lines for both the first and second week of monitoring are shown on maps in Section 1.3.

The manholes were equipped with Hach Marsh-McBirney Flo-Dar® AV Sensors and Loggers. With the installation and removal of the equipment, the manholes were opened and confined space entry was limited to crossing the plane with hands and arms, but not actually entering the manholes. Even though US³ personnel did not enter the manholes during equipment installation or removal, they were fully trained and certified in Confined Space Entry and CPR, and in accordance with safety standards, gas readings were taken and recorded throughout the duration of the installation and removal process.

In summary, US³ performed the following services as part of this project:

- Sewer Flow Monitoring
 - o Assessment of permitting and traffic control requirements
 - o Installation of Marsh-McBirney Flo-Dar® AV Sensor/s and Logger/s
 - Validation of hydraulic suitability
 - Calibration of flow monitoring equipment
 - Documentation of installation and calibration
 - o First week of flow monitoring between 09/24/2019 and 10/02/2019
 - o Second week of flow monitoring between 10/02/2019 and 10/10/2019
 - o Removal of flow monitoring equipment
 - o Validation of flow monitoring data
- Evaluation of the sanitary sewer at the monitored sites
- Development of a report to discuss the flow monitoring data, including system statistics and graphs

1.3 Site Maps

Figure above: The vicinity map shows the temporary wastewater flow monitoring location of the Nordstrom MH. The Nordstrom MH is located at latitude 33.915117 and longitude -117.888619.

Figure below: The sewer map shows the plan view of all seven of the monitored sewer lines.

Figures: The vicinity map (above) shows the temporary wastewater flow monitoring location of the Site 1 MH. The Site 1 MH is located at latitude 33.912802 and longitude -117.887424. The vicinity map (below) shows the temporary wastewater flow monitoring location of the Site 2 MH. The Site 2 MH is located at latitude 33.910330 and longitude -117.888919.

Figures: The vicinity map (above) shows the temporary wastewater flow monitoring locations of the Site 3A MH and the Site 3 MH. Site 3A MH is at latitude 33.909343 and longitude -117.889338 and Site 3 MH is at latitude 33.909322 and longitude -117.889302. The sewer map (below) shows the locations of Sites 3 and 4, which were incorrectly identified during the first week of monitoring.

Figures: The vicinity map (above) shows the temporary wastewater flow monitoring location of the Site 4 MH. The Site 4 MH is located at latitude 33.909049 and longitude -117.889105. The vicinity map (below) shows the temporary wastewater flow monitoring location of the Site 1 US MH, which was monitored concurrently with the Site 4 MH during the second week of monitoring. The Site 1 US MH is at latitude 33.915117 and longitude -117.888619 between the Nordstrom & Site 1 MHs.

Figure below: The map shows the Brea Mall and the proposed project, which is outlined with a dashed line and identified as “D”. The project proposes to change the current land use from strictly commercial to a mixed use of commercial and residential.

1.4 Summary of Sites

Figures below: The left photo shows the Nordstrom MH in the left-hand northbound lane at ~1048 Brea Mall. This was a commercial access road with a low speed limit, so the field team used cones, signs and an arrow board in accordance with CA WATCH Diagram 15 during installation and removal of the monitoring equipment. Surface conditions were dry. No issues were encountered during installation on 9/24/2019 or removal on 10/02/2019.

Figure at left: The Nordstrom MH provided access to an 8-inch (in) sewer line, which entered from the north and discharged to the southeast. Gas levels were good (well within OSHA acceptable limits: $O_2=20.9\%$; LEL, H_2S & $CO=0$). The flow monitoring equipment was set to monitor the downstream pipe as it provided the best hydraulics. Follow up on this installation confirmed equipment calibration.

Figures below: The left photo shows the Site 1 MH on the sidewalk at ~120 Brea Mall. This was adjacent to commercial access road with a low speed limit, so the field team used cones, signs and an arrow board in accordance with CA WATCH Diagram 2 during installation and removal of the monitoring equipment. Surface conditions were dry. No issues were encountered during installation on 9/24/2019 or removal on 10/02/2019.

Figure above: The Site 1 MH provided access to an 8-in sewer line, which entered from the northeast and discharged to the southwest. Two laterals entered from the northwest and southeast, but according to the sewer maps, there should only be one upstream line entering from the northwest. Gas levels were good. The flow monitoring equipment was set to monitor the downstream line to get the total flow. Follow up on this installation confirmed equipment calibration.

Figures below: The left photo shows the Site 2 MH on the sidewalk at ~405 S. State College Blvd. This was a commercial area, so the field team used cones and signs in accordance with CA WATCH Diagram 2 during installation and removal of the monitoring equipment, but no arrow board was needed because the parking lane was used. Surface conditions were dry. No issues were encountered during installation on 9/24/2019 or removal on 10/02/2019.

Figure at left: The Site 2 MH provided access to an 8-in sewer line, which entered from the northeast and discharged to the southwest. Gas levels were good. The flow monitoring equipment was set to monitor in the downstream direction in a position within the trough that provided the best hydraulics. Follow up on this installation confirmed equipment calibration.

Figures below: The left photo shows the Site 3A MH in the left-hand southbound lane at ~454 S. State College Blvd. This was a commercial area, so the field team used cones, signs and an arrow board in accordance with CA WATCH Diagram 15 during installation and removal of the monitoring equipment. Surface conditions were dry. No issues were encountered during installation on 9/24/2019 or removal on 10/02/2019.

Figure above: This site was originally believed to be the Site 3 MH, but was most likely a brine line since the manhole provided access to a 6-in line, which entered from the southeast and discharged to the northwest. Follow up on this installation determined that the equipment was in the wrong manhole. The next available field crew was dispatched on 10/02/2019 to find the correct manhole in the park.

Figures below: The left photo shows the Site 3 MH in the center of the painted median at ~454 S. State College Blvd. This was a commercial area, so the field team used cones and signs in accordance with CA WATCH Diagram 20 during installation and removal of the monitoring equipment. Surface conditions were dry. No issues were encountered during installation on 9/24/2019 or removal on 10/02/2019.

Figure above: This site was originally believed to be the Site 4 MH, but was actually the Site 3 MH. The manhole provided access to an 18-in line, which entered from the northwest and discharged to the southeast. Two laterals entered from the north; one was a drop inlet, but no flow was observed. Follow up on this installation confirmed equipment calibration.

Figures below: The photo shows the Site 4 MH in the park, east of ~471 S. State College Blvd. This was open green space, so the field team used cones to delineate their work zone during installation and removal of the monitoring equipment. Surface conditions were dry. No issues were encountered during installation on 10/02/2019 or removal on 10/10/2019.

Figure above: The manhole provided access to an 18-in sewer line, which entered from the northwest and discharged to the southeast. One lateral entered from the north. Gas levels were good. The flow monitoring equipment was set to monitor the downstream line to get the total flow. Follow up on this installation confirmed equipment calibration.

Figures below: The photo shows the Site 1 US MH on the centerline at ~120 Brea Mall. This was a commercial access road with a low speed limit, so the field team used cones and signs in accordance with CA WATCH Diagram 7 during installation and removal of the monitoring equipment. Surface conditions were dry. No issues were encountered during installation on 10/04/2019 or removal on 10/10/2019.

Figure above: The manhole provided access to an 8-in sewer line with two inlets, one from the northwest and one from the southwest, discharging to the southeast, but according to the sewer maps, there should only be one upstream line entering from the north. This site was selected for monitoring with the Site 4 MH because it was between the Nordstrom MH and the Site 1 MH. Gas levels were good. The flow monitoring equipment was set to monitor the downstream line to get the total flow. Follow up on this installation confirmed equipment calibration.

1.5 Existing Capacity Analysis

The capacity evaluation method conformed to the following process:

1. Collect 15-minute interval depth and velocity data points at each site over the entire monitoring period and determine the depth versus (vs) velocity relationship or pipe curve based on Manning's equation.
2. Determine statistically the minimum, maximum and average depths and flow rates at each site during the monitoring period.
3. Calculate the maximum theoretical unobstructed flow rate at each site.
4. Determine remaining capacity under peak flow conditions at each site, using the ratios of actual daily flow depths to pipe diameter.

Figures below: Nordstrom MH graphs of level, flow & velocity, and scatter plot of level in relation to velocity from US³ Flow Monitoring Website (<http://us3.uscubed.com/>)

The scatter plot on the previous page shows the depth vs velocity data points for the monitored pipe. The pattern of velocity and depth data points for a sewer operating in free-flow conditions over an extended period of time should conform to the depth-velocity relationship of Manning's Equation, which is the basis for evaluating flow monitoring data. This equation (shown below) defines a commonly used theoretical relationship between depth and velocity in pipes operating under free flow conditions:

$$v = 1.486/n \times R^{2/3} \times S^{1/2}$$

Where,

v = velocity (fps)

n = pipe roughness, defined as the Manning's Roughness Coefficient

R = hydraulic radius,
defined as wetted area (ft²) divided by wetted perimeter (ft)

S = hydraulic slope

The scatter plot from the Nordstrom MH shows the depth vs velocity data points for the 8-in downstream pipe, which should resemble a theoretical hydraulic operating curve based on the site-specific characteristics of the pipe. Using velocities from this study in conjunction with the associated cross-sectional areas depicted by the monitored levels, the flow was calculated using the Continuity Equation, and then the slope was derived using Manning's Equation. Therefore, the calculated slope is based on the average flow data observed during the study. Velocity and level readings were compared to theoretical hydraulic operating curves at different slopes, correlating with an operating curve with a slope of ~6.39% ($S=0.06389617$). According to the raSmith utility plan (UP-02A), the slope of the line downstream from the Nordstrom MH should be 1.7%.

Figure at right: This theoretical pipe curve was generated for an 8-in (0.67-ft) pipe with a slope of ~6.39%.

Figure above: Since the flows at the Nordstrom MH utilized ~7% to ~22% of the pipe depth during the study, that portion of its theoretical curve has been overlaid onto its scatter plot.

As shown in the scatter plot above, while a majority of the data falls into an acceptable area along the theoretical curve, there is a curvature to the data that is inconsistent with the theoretical curve. However, the curvature suggests that the data is trending toward higher velocities than expected as the levels increase.

To summarize the site statistics from the data analysis at the Nordstrom MH:

- During peak flows, 0.1090 million gallons per day (mgd) or ~76 gallons per minute (gpm) utilized ~8% of the pipe's capacity.
- During average flows, 0.1173 mgd or ~32 gpm utilized ~3.5% of the pipe's capacity.
- According to common practice in sewer system design, velocities need to exceed 2.0 fps a minimum (min) of once per day to provide sufficient scouring action for self-cleaning. The maximum velocity at the Nordstrom MH was 3.16 fps with an average velocity of 2.72 fps. Therefore, this site should have no issues with regard to settlement of normal system solids.
- According to the Brea Sewer System Management Plan, the depth versus diameter (d/D) ratio for existing collection system pipes of 15 inches in diameter or less should be no more than 0.50 during dry weather peak flow conditions. The average d/D ratio from the Nordstrom MH during this study was ~0.13 and the maximum (max) was ~0.22. Therefore, this 8-in pipe had capacity available during the observed dry weather peak flow.

The following is a graphical representation of site statistics (stats) from the data analysis:

The pipe capacity was estimated using a Manning's Circular Pipe Flow Capacity chart, where $n=0.013$ (in accordance with the minimum value for a vitrified clay sewer pipe (VCP) with manholes, inlets, etc., Chow 1959). From the theoretical hydraulic operating curve for an 8-in pipe with a slope of $\sim 6.39\%$ ($S=0.06389617$), with the pipe completely full, the velocity is expected to be ~ 5.8890 fps. When this velocity is input into the FloWare program from the Nordstrom MH, a maximum capacity of ~ 1.3286 mgd is produced. This is a reasonable assumption based on the average levels and velocities observed during the monitoring study.

Nordstrom MH Level (depth) vs Pipe Diameter

Figures below: Site 1 MH graphs of level, flow & velocity, and scatter plot of level in relation to velocity from US³ Flow Monitoring Website (<http://us3.uscubed.com/>)

The scatter plot above shows the depth vs velocity data points for the 8-in downstream pipe, which should resemble a theoretical hydraulic operating curve based on the site-specific characteristics of the pipe. Actual velocities and levels were compared to theoretical hydraulic operating curves at different slopes, which led to the conclusion that the data best resembles a curve with the slope of ~0.74% ($S=0.0073879$) at the Site 1 MH. According to the raSmith utility plan (UP-02A), the slope of the line downstream from the Site 1 MH should be 1.3%.

Figure above: Since the flows at the Site 1 MH utilized ~17% to ~48% of the pipe depth during the study, that portion of its theoretical curve has been overlaid onto its scatter plot.

As shown in the scatter plot above, a majority of the data falls into an acceptable area along the theoretical curve, but the distribution of the data is probably due to the hydraulics within the manhole. From the photos, it appears that inflow from the northwest line is causing turbulence, perhaps even a backwater effect in the two other upstream lines.

To summarize the site statistics from the data analysis at the Site 1 MH:

- During peak flows, 0.2194 mgd or ~152 gpm utilized ~48.5% of the pipe's capacity.
- During average flows, 0.1021 mgd or ~71 gpm utilized ~23% of the pipe's capacity.
- The maximum velocity at the Site 1 MH was 2.43 fps with an average velocity of 1.60 fps. Since velocities only exceeded 2 fps on five days during this 9-day study, over time, this site is likely to have issues due to settlement of normal system solids.
- The average d/D ratio from the Site 1 MH during this study was ~0.32 and the maximum was ~0.48. Therefore, this 8-in pipe had some capacity available during the observed dry weather peak flow.

The following is a graphical representation of the site statistics from the data analysis:

The pipe capacity was estimated using a Manning's Circular Pipe Flow Capacity chart, where $n=0.013$ (in accordance with the minimum value for a VCP with manholes, inlets, etc., Chow 1959). From the theoretical hydraulic operating curve for an 8-in pipe with a slope of $\sim 0.74\%$ ($S=0.0073879$), with the pipe completely full, the velocity should be ~ 2.0025 fps, which when input into the Flo-Ware program from the Site 1 MH produced a maximum capacity of ~ 0.4518 mgd. This is a slightly conservative assumption based on the average levels and velocities observed during the monitoring study.

Site 1 MH Level (depth) vs Pipe Diameter

Figures below: Site 2 MH graphs of level, flow & velocity, and scatter plot of level in relation to velocity from US³ Flow Monitoring Website (<http://us3.uscubed.com/>)

The scatter plot above shows the depth vs velocity data points for the 8-in downstream pipe, which should resemble a theoretical hydraulic operating curve based on the site-specific characteristics of the pipe. Actual velocities and levels were compared to theoretical hydraulic operating curves at different slopes, which led to the conclusion that the data best resembles a curve with the slope of ~4.13% ($S=0.04133756$) at the Site 2 MH. According to the raSmith utility plan (UP-02B), the slope of the line upstream from the Site 2 MH should be 3.0%, while the slope of the line downstream from the Site 2 MH should be 2.16%.

Figure above: Since the flows at the Site 2 MH utilized ~17% to ~29% of the pipe depth during the study, that portion of its theoretical curve has been overlaid onto its scatter plot.

As shown in the scatter plot above, the expected relationship between level and velocity is not prevalent. While some of the data points fall into an acceptable area along the theoretical curve, this data set is more of a cloud formation, which is indicative of processed or non-conforming flow. This is flow that does not conform to the theoretical level-velocity relationship expected under free-flow conditions, such as what occurs during dumping, jetting, pumping, etc. This type of flow is more common in commercial and industrial areas because they are more likely to generate processed flows.

To summarize the site statistics from the data analysis at the Site 2 MH:

- During peak flows, 0.1798 mgd or ~125 gpm utilized ~17% of the pipe's capacity.
- During average flows, 0.1211 mgd or ~84 gpm utilized ~11% of the pipe's capacity.
- The maximum velocity at the Site 2 MH was 3.78 fps with an average velocity of 3.14 fps. Therefore, this site should have no issues with regard to blockage due to settlement of normal system solids.
- The average d/D ratio from the Site 2 MH during this study was ~0.23 and the maximum was ~0.29. Therefore, this 8-in pipe had capacity available during the observed dry weather peak flow.

The following is a graphical representation of the site statistics from the data analysis:

The pipe capacity was estimated using a Manning's Circular Pipe Flow Capacity chart, where $n=0.013$ (in accordance with the minimum value for a VCP with manholes, inlets, etc., Chow 1959). From the theoretical hydraulic operating curve for an 8-in pipe with a slope of $\sim 4.13\%$ ($S=0.04133756$), with the pipe completely full, the velocity should be ~ 4.7367 fps, which when input into the Flo-Ware program from the Site 2 MH produced a maximum capacity of ~ 1.0686 mgd. This is a conservative assumption based on the average levels and velocities observed during the monitoring study.

Site 2 MH Level (depth) vs Pipe Diameter

Figures below: Site 3 MH graphs of level, flow & velocity, and scatter plot of level in relation to velocity from US³ Flow Monitoring Website (<http://us3.uscubed.com/>)

The scatter plot above shows the depth vs velocity data points for the 18-in downstream pipe, which should resemble a theoretical hydraulic operating curve based on the site-specific characteristics of the pipe. Actual velocities and levels were compared to theoretical hydraulic operating curves at different slopes, which led to the conclusion that the data best resembles a curve with the slope of ~1.49% ($S=0.014924692$) at the Site 3 MH. According to the raSmith utility plan (UP-02B), the slope of the line upstream from the Site 3 MH should be 2.16%.

Figure above: Since the flows at the Site 3 MH utilized ~20% to ~36% of the pipe depth during the study, that portion of its theoretical curve has been overlaid onto its scatter plot.

As shown in the scatter plot above, while a majority of the data falls into an acceptable area along the theoretical curve, the level to velocity relationship is slightly skewed at lower levels. This could indicate that some form of blockage is slowing velocities at lower levels, which does not hinder the higher levels. This crossover is between ~4.4 and 5 inches of depth.

To summarize the site statistics from the data analysis at the Site 3 MH:

- During peak flows, 1.5150 mgd or ~1052 gpm utilized ~27% of the pipe's capacity.
- During average flows, 1.0278 mgd or ~714 gpm utilized ~18% of the pipe's capacity.
- The maximum velocity at the Site 3 MH was 4.67 fps with an average velocity of 3.70 fps. Therefore, this site should have no issues with regard to blockage due to settlement of normal system solids.
- According to the Brea Sewer System Management Plan, the depth versus diameter (d/D) ratio for existing collection system pipes of greater than 15 inches in diameter should be no more than 0.64 during dry weather peak flow conditions. The average d/D ratio from the Site 3 MH during this study was ~0.29 and the maximum was ~0.35. Therefore, this 18-in pipe had capacity available during the observed dry weather peak flow.

The following is a graphical representation of the site statistics from the data analysis:

The pipe capacity was estimated using a Manning's Circular Pipe Flow Capacity chart, where $n=0.013$ (in accordance with the minimum value for a VCP with manholes, inlets, etc., Chow 1959). From the theoretical hydraulic operating curve for an 18-in pipe with a slope of $\sim 1.49\%$ ($S=0.014924692$), with the pipe completely full, the velocity should be ~ 4.8869 fps, which when input into the Flo-Ware program from the Site 3 MH produced a maximum capacity of ~ 5.5815 mgd. This is a conservative assumption based on the average levels and velocities observed during the monitoring study.

Site 3 MH Level (depth) vs Pipe Diameter

Figures below: Site 4 MH graphs of level, flow & velocity, and scatter plot of level in relation to velocity from US³ Flow Monitoring Website (<http://us3.uscubed.com/>)

The scatter plot above shows the depth vs velocity data points for the 18-in downstream pipe, which should resemble a theoretical hydraulic operating curve based on the site-specific characteristics of the pipe. Actual velocities and levels were compared to theoretical hydraulic operating curves at different slopes, which led to the conclusion that the data best resembles a curve with the slope of ~2.14% ($S=0.02136942$) at the Site 4 MH.

Figure above: Since the flows at the Site 4 MH utilized ~14% to ~27% of the pipe depth during the study, that portion of its theoretical curve has been overlaid onto its scatter plot.

As shown in the scatter plot above, while a majority of the data falls into an acceptable area along the theoretical curve, there are quite a few outliers. In addition, there appears to be a secondary flow pattern at lower levels, which could be flow from the lateral when the mainline flow slows.

To summarize the site statistics from the data analysis at the Site 4 MH:

- During peak flows, 1.0417 mgd or ~723 gpm utilized ~16% of the pipe's capacity.
- During average flows, 0.7221 mgd or ~501 gpm utilized ~11% of the pipe's capacity.
- The maximum velocity at the Site 4 MH was 4.49 fps with an average velocity of 3.80 fps. Therefore, this site should have no issues with regard to blockage due to settlement of normal system solids.
- The average d/D ratio from the Site 4 MH during this study was ~0.22 and the maximum (max) was ~0.27. Therefore, this 18-in pipe had capacity available during the observed dry weather peak flow.

The following is a graphical representation of the site statistics from the data analysis:

The pipe capacity was estimated using a Manning's Circular Pipe Flow Capacity chart, where $n=0.013$ (in accordance with the minimum value for a VCP with manholes, inlets, etc., Chow 1959). From the theoretical hydraulic operating curve for an 18-in pipe with a slope of $\sim 2.14\%$ ($S=0.02136942$), with the pipe completely full, the velocity should be ~ 5.8475 fps, which when input into the Flo-Ware program from the Site 4 MH produced a maximum capacity of ~ 6.6787 mgd. This is a conservative assumption based on the average levels and velocities observed during the monitoring study.

Site 4 MH Level (depth) vs Pipe Diameter

Figures below: Site 1 US MH graphs of level, flow & velocity, and scatter plot of level in relation to velocity from US³ Flow Monitoring Website (<http://us3.uscubed.com/>)

The scatter plot above shows the depth vs velocity data points for the 8-in downstream pipe, which should resemble a theoretical hydraulic operating curve based on the site-specific characteristics of the pipe. Actual velocities and levels were compared to theoretical hydraulic operating curves at different slopes, which led to the conclusion that the data best resembles a curve with the slope of ~1.00% ($S=0.01001235$) at the Site 1 US MH. According to the raSmith utility plan (UP-02A), the slope of the line downstream from the Site 1 US MH should be 1.1%.

Figure above: Since the flows at the Site 1 US MH utilized ~17% to ~50% of the pipe depth during the study, that portion of its theoretical curve has been overlaid onto its scatter plot.

As shown in the scatter plot above, the data follows the expected level to velocity relationship, although the level to velocity relationship is slightly skewed at higher levels.

To summarize the site statistics from the data analysis at the Site 1 US MH:

- During peak flows, 0.2770 mgd or ~192 gpm utilized ~53% of the pipe's capacity.
- During average flows, 0.1344 mgd or ~93 gpm utilized ~26% of the pipe's capacity.
- The maximum velocity at the Site 1 US MH was 2.66 fps with an average velocity of 1.92 fps. Since velocities exceeded 2 fps every day during this study except for the day of removal, this site should have no issues with regard to blockage due to settlement of normal system solids.
- The average d/D ratio from the Site 1 US MH during this study was ~0.33 and the maximum was ~0.50. Therefore, this 8-in pipe reached its maximum capacity during this dry weather flow monitoring study.

The following is a graphical representation of the site statistics from the data analysis:

The pipe capacity was estimated using a Manning's Circular Pipe Flow Capacity chart, where $n=0.013$ (in accordance with the minimum value for a VCP with manholes, inlets, etc., Chow 1959). From the theoretical hydraulic operating curve for an 8-in pipe with a slope of $\sim 1.00\%$ ($S=0.01001235$), with the pipe completely full, the velocity should be ~ 2.3312 fps, which when input into the Flo-Ware program from the Site 1 US MH produced a maximum capacity of ~ 0.5259 mgd. This is a slightly conservative assumption based on the average levels and velocities observed during the monitoring study.

Site 1 US MH Level (depth) vs Pipe Diameter

1.6 Proposed Flow Generation

The Brea Mall currently encompasses approximately 1,291,433 square feet (sf) and consists of a central retail core of major department stores (“anchors”). Sears, which was the anchor on the southwest side of the mall, closed in April 2018. Therefore, the Simon Property Group is proposing redevelopment of the 17.5-acre Sears parcel, which includes the adjoining transition areas adjacent to Nordstrom and Macy’s. The proposed project involves demolishing the Sears department store and associated auto center (161,990 sf) and 12 acres of surface parking in order to allow a mix of uses: retail, for-rent residential apartments, a resort-type fitness center, and a large green space with plaza.

Table 1 Brea Mall Mixed Use Project Land Use Summary

Tenant	Existing GLA (sq. ft.)	Demolition (sq. ft.)	New Construction GLA (sq. ft.)	Total Mall GLA (sq. ft.)
Major Department Stores				
Sears	161,990	-161,990	—	0
Macy’s ¹	182,360	—	—	182,360
Nordstrom	176,540	—	—	176,540
JC Penny	135,800	—	—	135,800
Macy’s Men & Home	192,060	—	—	192,060
Major Department Stores	646,750	-161,990	0	686,760
Small Shops				
Sporting Goods	—	—	50,019	50,019
Fitness Center	—	—	128,000	128,000
Level 1 Mall	224,522	—	123,053	347,575
Level 2 Mall	207,992	—	10,543	218,535
Total Small Shops	432,514	0	311,615	744,129
Outlots¹				
Cheesecake Factory Outlot	10,169	—	—	10,169
Total Mall	1,291,433	-161,990	311,615	1,441,058
Residential				
Medium Density Residential (7-story)	—	—	312 units	312 units
Residential Square Feet	—	—	380,947	
Net Change from Existing	—	—	312	149,625

GLA = gross leasable area

¹ Macy’s owns the buildings occupied by Red Lobster and Olive Garden; therefore, the GLA for Macy’s includes these restaurants. BJ’s is not owned by Simon properties; therefore, the square footage for this outlot facility is not included in this table.

Figure above: Shows a project land use summary dated 08/15/2019.

The project would result in a net increase of 149,625 sf of commercial space (small shops and a fitness center) and 312 residential dwelling units.

The proposed flow generation was provided on the raSmith utility plan (UP-02C):

- 12,800 gallons per day (gpd) from the Fitness Center = 0.0128 mgd
- 131,306 gpd from the Mall Shops = 0.131306 mgd
- 41,850 gpd from the Residential Units = 0.04185 mgd

In accordance with the Brea Sewer System Management Plan, peak dry weather flow (PDWF) was calculated using the following equation.

$$\text{PDWF (mgd)} = 1.777 \times \text{Average Dry Weather Flow (ADWF)}^{0.92}$$

User Category	Proposed ADWF (gpd)	Proposed ADWF (mgd)	Proposed PDWF (mgd)
Fitness Center	12,800	0.0128	0.03223
Brea Mall Shops	131,306	0.131306	0.27448
Residential Units	41,850	0.04185	0.09586
Total			0.40257

Monitored Sites	Actual ADWF (mgd)	Calculated PDWF (mgd)	Actual PDWF (mgd)
Nordstrom MH	0.0464	0.1054	0.1090
Site 1 MH	0.1021	0.2178	0.2194
Site 2 MH	0.1211	0.2548	0.1798
Site 3 MH	1.0278	1.8224	1.5150
Site 1 US MH	0.1344	0.2804	0.2770
Site 4 MH	0.7221	1.3170	1.0417

The higher PDWF will be used in the final calculations in the conclusions.

1.7 Summary of Results

Calculations in this report are based on steady uniform flow with steady flow defined as the discharge being constant with time, and uniform flow defined as the slope of the water surface and cross-sectional flow area being constant in the length of pipe analyzed. Using velocities from this study in conjunction with the associated cross-sectional areas depicted by the monitored levels, the flow was calculated using the Continuity Equation, and the slope was derived using Manning's Equation.

The flow monitoring equipment at each site was calibrated with regard to site-specific characteristics and manual level and velocity readings for adjustment and verification. Follow-up on the installations confirmed equipment was reading properly at the sites. In addition, all of the equipment went through diagnostic testing before and after the study with less than a 1% deviation between manual and meter level readings and less than a 5% deviation between manual and meter velocity readings. Therefore, equipment calibration was verified in accordance with manufacturer specifications.

Initial flow monitoring for this project began on 09/24/2019 in accord with the supplied sewer map at right. This is also referred to as the first week of monitoring. The Nordstrom MH is not shown but was included in the first week of monitoring.

When the field installation forms and photos were reviewed, it was determined that Site 3 was actually the small line coming up from the southwest and Site 4 was actually Site 3. Therefore, on 10/02/2019, the US³ field team searched the area and found Site 4 in the park, ~50 ft east of the road. Therefore, flow monitoring began at Site 4 at the same time that monitoring was completed at Sites 1, 2 and 3 and at the Nordstrom MH.

2019.09 Nordstrom MH: The graphs for this 8-in sewer line showed a fairly consistent daily flow pattern. In addition, velocities exceeded the minimum requirements to provide sufficient scouring action for self-cleaning as well as providing good capacity within the line. As previously stated, the utility plans showed the downstream slope for this section of

sewer line to be 1.7% and the calculated slope based on the average flow data observed during the study was ~6.39%. It is unusual for the as-built slope to match field conditions, but normally, there is not this much difference between them. There can be many reasons why the theoretical slope differs from the actual slope, such as backwater, blockages, drops within the manhole or subsidence along the line. At this site, no obvious reason was observed. The calculated slope was based on the average flow data observed during the study, and the scatter plot on page 18 of this report shows how the theoretical curve based on the calculated slope lines up with the actual flow data.

In order to determine the maximum allowable flow within the pipe segment downstream of the Nordstrom MH, the calculated slope (~6.39%) was used to generate a theoretical hydraulic operating curve for an 8-in pipe. At half pipe (4 inches), the velocity from the theoretical curve was ~5.8888 fps, which when input into the Flo-Ware program from the Nordstrom MH produced an expected capacity of ~0.6643 mgd. Since peak flow was 0.1090 mgd, there should be capacity available for an additional 0.5553 mgd before the pipe exceeds its d/D limit of 0.50 at peak flow. This is a reasonable assumption since the average maximum velocity from the study (3.06 fps) coincided with an average level of ~1.1988 inches, and according to the theoretical curve, the velocity at ~1.1988 inches should be ~3.0413 fps.

2019.09 Site 1 MH: The graphs for this site showed a fairly consistent daily flow pattern, but the level to velocity relationship could indicate a hydraulic issue within this confluence. In addition, velocities only met the minimum requirements to provide sufficient scouring action for self-cleaning on five days during this 9-day study. As previously stated, the utility plans showed the downstream slope for this section of sewer line to be 1.3% and the calculated slope based on the average flow data observed during the study was ~0.74%.

In order to determine the maximum allowable flow within the pipe segment downstream of the Site 1 MH, the calculated slope (~0.74%) was used to generate a theoretical hydraulic operating curve for an 8-in pipe. At half pipe (4 inches), the velocity from the theoretical curve was ~2.0024 fps, which when input into the Flo-Ware program from the Site 1 MH produced an expected capacity of ~0.2259 mgd. Since peak flow was 0.2194 mgd, there should be capacity available for an additional 0.0065 mgd before the pipe exceeds its d/D limit of 0.50 at peak flow. This is a slightly conservative assumption since the average maximum velocity from the study (2.00 fps) coincided with an average level of ~3.3933 inches, and according to the theoretical curve, the velocity at ~3.3933 inches should be ~1.8586 fps.

2019.09 Site 2 MH: The graphs for this site showed a fairly consistent daily level, but the velocities did not follow any observable pattern. This resulted in a data set resembling a cloud formation, which is indicative of processed or non-conforming flow. However, velocities did exceed the minimum requirements for self-cleaning as well as providing good

capacity within the line. As previously stated, the utility plans showed the upstream slope to be 3.0% and the downstream slope to be 2.16%, while the calculated slope based on the average flow data observed in the downstream line was ~4.13%.

In order to determine the maximum allowable flow within the pipe segment downstream of the Site 2 MH, the calculated slope (~4.13%) was used to generate a theoretical hydraulic operating curve for an 8-in pipe. At half pipe (4 inches), the velocity from the theoretical curve was ~4.7365 fps, which when input into the Flo-Ware program from the Site 2 MH produced an expected capacity of ~0.5343 mgd. Since peak flow was 0.1798 mgd, there should be capacity available for an additional 0.3545 mgd before the pipe exceeds its d/D limit of 0.50 at peak flow. This is a conservative assumption since the average maximum velocity from the study (3.58 fps) coincided with an average level of 1.586 inches, and according to the theoretical curve, the velocity at 1.586 inches should be ~2.8981 fps.

2019.09 Site 3 MH: This site was originally believed to be the Site 4 MH, but was actually the Site 3 MH. The graphs for this site showed a fairly consistent daily flow pattern. In addition, velocities exceeded the minimum requirements for self-cleaning as well as providing good capacity within the line. As previously stated, the utility plans showed the upstream slope for this section of sewer line to be 2.16% and the calculated slope based on the average flow data observed in the downstream line was ~1.49%.

In order to determine the maximum allowable flow within the pipe segment downstream of the Site 3 MH, the calculated slope (~1.49%) was used to generate a theoretical hydraulic operating curve for an 18-in pipe. At the d/D limit (11.52 inches), the velocity from the theoretical curve was ~5.3483 fps, which when input into the Flo-Ware program from the Site 3 MH produced an expected capacity of ~4.1287 mgd. Since peak flow was 1.5150 mgd, there should be capacity available for an additional 2.6137 mgd before the pipe exceeds its d/D limit of 0.64 at peak flow. This is a conservative assumption since the average maximum velocity from the study (4.33 fps) coincided with an average level of ~5.5908 inches, and according to the theoretical curve, the velocity at ~5.5908 inches should be ~3.8655 fps.

2019.09 Site 3A MH: This site was originally believed to be the Site 3 MH, but was actually determined to be a brine line. Since this was not one of the required monitoring sites, no data analysis was performed on the data.

2019.09 Site 4 MH: On 10/02/2019, the US³ field team searched the area and found this site in the park, ~50 ft east of the road. Therefore, flow monitoring began at the Site 4 MH at the same time that monitoring was completed at the other four sites.

The graphs for the Site 4 MH showed a fairly consistent daily level. The velocity readings were not as consistent as the level readings, but the overall level to velocity relationship

was not bad. In addition, velocities exceeded the minimum requirements for self-cleaning as well as providing good capacity within the line.

In order to determine the maximum allowable flow within the pipe segment downstream of the Site 4 MH, the calculated slope based on the average flow data observed during the study (~2.14%) was used to generate a theoretical hydraulic operating curve for an 18-in pipe. At the d/D limit (11.52 inches), the velocity from the theoretical curve was ~6.3997 fps, which when input into the Flo-Ware program from the Site 4 MH produced an expected capacity of ~4.9404 mgd. Since peak flow was 1.0417 mgd, there should be capacity available for an additional 3.8987 mgd before the pipe exceeds its d/D limit of 0.64 at peak flow. This is a conservative assumption since the average maximum velocity from the study (4.31 fps) coincided with an average level of 4.254 inches, and according to the theoretical curve, the velocity at 4.254 inches should be ~3.9667 fps.

It was determined on 10/04/2019 that upstream onsite monitoring should occur in conjunction with monitoring at the Site 4 MH. Therefore, the US³ field team installed equipment one manhole upstream of the Site 1 MH. This site was chosen because it had better hydraulics than the Site 1 MH and was between the two original manhole monitoring locations.

Second Week of Monitoring	
Site 4 MH location	Site 1 US MH location
	

2019.09 Site 1 US MH: The graphs for this site showed a fairly consistent daily flow pattern with a good level to velocity relationship. In addition, velocities exceeded the minimum requirements for self-cleaning every day during this study except for the day of removal. As previously stated, the utility plans showed the downstream slope for this section of sewer line to be 1.1% and the calculated slope based on the average flow data observed during the study was ~1.00%.

In order to determine the maximum allowable flow within the pipe segment downstream of the Site 1 US MH, the calculated slope (~1.00%) was used to generate a theoretical hydraulic operating curve for an 8-in pipe. At half pipe (4 inches), the velocity from the theoretical curve was ~2.3311 fps, which when input into the Flo-Ware program from the Site 1 US MH produced an expected capacity of ~0.2630 mgd. Since peak flow was 0.2770 mgd, the sewer line did not have any additional capacity available at peak flow. This is a slightly conservative assumption since the average maximum velocity from the study (2.41 fps) coincided with an average level of ~3.6713 inches, and according to the theoretical curve, the velocity at ~3.6713 inches should be ~2.2448 fps.

1.8 Conclusions

The first week of flow monitoring at the Nordstrom MH and the Site 1, 2 and 3 MHs was completed on 10/02/2019, which is when the second week of flow monitoring began at the Site 4 MH. Flow monitoring began at the Site 1 US MH on 10/04/2019 and was completed on 10/10/2019 at the Site 1 US MH and the Site 4 MH.

It was noted that the flows increased at the Site 1 US MH during the second week of monitoring when compared to Site 1 MH during the first week of monitoring and yet decreased at the Site 4 MH during the second week of monitoring when compared to the Site 3 MH during the first week of monitoring. It is not unusual for flows to change from week to week for many different reasons. Unfortunately, no additional information can be provided as to the causes.

According to conceptual sanitary sewer plan for the Brea Mall Mixed Use Project, the peak dry weather flow is projected to be 0.40257 mgd. This proposed flow will be added to the existing flows to identify capacity limitations. In addition, the City has requested that the proposed flow from the Birch & State College Mixed-Use Development be added to the flow at the Site 4 MH. This flow (1.03 mgd) will be entering the Site 4 MH from its northern lateral, so this flow will not affect any of the other monitored sites. Therefore, the total flow added to the Site 4 MH will be 1.43257 mgd, and as stated in the Proposed Flow Generation section of this report, the PDWF values used in the final calculations will be the greater value between the actual and the calculated PDWFs.

The table below is a summary of the flow data with regard to the d/D capacity limit.

Existing + Proposed Flow Information	Existing PDWF (mgd)	Proposed PDWF (mgd)	Total PDWF (mgd)	Estimated d/D Pipe Capacity (mgd)	Available Capacity (mgd)	Total PDWF d/D
Nordstrom MH	0.1090	0.40257	0.51157	0.6643	0.15273	0.43
Site 1 MH	0.2194		0.62197	0.2259	-0.39607	>1
Site 2 MH	0.2548		0.65737	0.5343	-0.12307	0.57
Site 3 MH	1.8224		2.22497	4.1287	1.90373	0.44
Site 1 US MH	0.2804		0.68297	0.2630	-0.41997	>1
Site 4 MH	1.3170	1.43257	2.74957	4.9404	2.19083	0.45

In order to determine the d/D of the total PDWF, the calculated slope from the Nordstrom MH (~6.39%) was used to generate a theoretical hydraulic operating curve for an 8-in pipe, at ~3.4445 inches, the velocity is expected to be ~5.5053 fps, which when input into the Flo-Ware program from the Nordstrom MH produced the estimated PDWF of 0.51157 mgd, and $d/D = 3.4445/8 = \sim 0.4306$.

The same method was used to calculate the d/D for remaining sites. Using the calculated slopes, respectively, from the Site 1 MH and the Site 1 US MH, the estimated PDWF exceeded the theoretical hydraulic operating curves for each 8-in pipe.

Using the calculated slope from the Site 2 MH (~4.13%) to generate a theoretical hydraulic operating curve for an 8-in pipe, at ~4.5366 inches, the velocity is expected to be ~4.9796 fps, which when input into the Flo-Ware program from the Site 2 MH produced the estimated PDWF of 0.65737 mgd, and $d/D = 4.5366/8 = \sim 0.5671$.

Using the calculated slope from the Site 3 MH (~1.49%) to generate a theoretical hydraulic operating curve for an 18-in pipe, at ~7.9020 inches, the velocity is expected to be ~4.6106 fps, which when input into the Flo-Ware program from the Site 3 MH produced the estimated PDWF of 2.22497 mgd, and $d/D = 4.902/18 = \sim 0.4390$.

Using the calculated slope from the Site 4 MH (~2.14%) to generate a theoretical hydraulic operating curve for an 18-in pipe, at ~8.0467 inches, the velocity is expected to be ~5.5637 fps, which when input into the Flo-Ware program from the Site 4 MH produced the estimated PDWF of 2.74957 mgd, and $d/D = 8.0467/18 = \sim 0.4470$.

Since the capacity of a system is contingent upon its most limited segment, the Site 1 MH and the Site 1 US MH are the limiting factors, but the Brea Mall Mixed Use Project proposes to replace the existing onsite sewer line, which would need to convey the existing flows measured during the monitoring in addition to the proposed flows.

Since the Site 1 US MH measured the highest flows during the monitoring study, the new pipe should convey a total estimated onsite PDWF of 0.68297 mgd without exceeding the d/D limit of 0.50. Using the proposed slope from the new sewer line ($\sim 0.40\%$) to generate a theoretical hydraulic operating curve for an 8-in pipe, the total estimated onsite PDWF does not fit within the pipe. The slope of an 8-in pipe would have to be at least 6.76% to convey 0.68297 mgd without exceeding the d/D limit of 0.50.

Using the proposed slope from the new sewer line ($\sim 0.40\%$) to generate a theoretical hydraulic operating curve for a 12-in pipe, at ~ 7.3758 inches, the velocity is expected to be ~ 2.0870 fps, which produced the estimated PDWF of 0.68297 mgd, and $d/D = 7.3758/12 = \sim 0.6146$.

Using the proposed slope from the new sewer line ($\sim 0.40\%$) to generate a theoretical hydraulic operating curve for a 15-in pipe, at ~ 6.2832 inches, the velocity is expected to be ~ 2.1680 fps, which produced the estimated PDWF of 0.68297 mgd, and $d/D = 6.2832/15 = \sim 0.4189$.

By changing the proposed slope to 0.77% and generating a theoretical hydraulic operating curve for a 12-in pipe, at 6.0 inches, the velocity is expected to be ~ 2.6909 fps, which produced the estimated PDWF of 0.68297 mgd, and $d/D = 6/12 = \sim 0.50$.

By changing the proposed slope to 2.06% and generating a theoretical hydraulic operating curve for a 10-in pipe, at ~ 4.9961 inches, the velocity is expected to be ~ 3.8787 fps, which produced the estimated PDWF of 0.68297 mgd, and $d/D = 4.9961/10 = \sim 0.4996$.

The downstream 8-in pipe at the Site 2 MH can convey the PDWF observed during this study plus the proposed PDWF from the project, but the d/D was calculated to be ~ 0.57 . This, however, is a conservative assumption based on the average levels and velocities observed during the monitoring study. The downstream 18-in pipes have adequate capacity for the proposed projects since the d/D for the PDWF observed during this study plus the proposed PDWF from the projects did not exceed the d/D limit of 0.64 at either site.

Tab 3: Methods & Procedures & Equipment**3.1 Methods and Procedures**

Utility Systems Science & Software provided raSmith with an off the shelf, non-proprietary flow monitoring solution that included seven state of the art Hach Flo-Dar® AV Sensor systems. The project course of action is listed below. The US³ team:

- Assessed permitting and traffic control at the monitoring sites within the Brea Mall and on S. State College Blvd in Brea, CA.
- Validated the sites for suitability for sewer flow monitoring.
- Submitted the appropriate site-specific Work Area Traffic Control Handbook (WATCH) diagrams for traffic control and obtained City Encroachment Permits.
- Coordinated with Mall Security for installation and removal of equipment.
- Installed and removed traffic control in accord with the approved WATCH diagrams for both the installation and removal of equipment.
- Installed and calibrated the flow monitoring equipment per manufacturer recommendations on 9/24/2019, 10/02/2019 and 10/04/2019.
- Removed the equipment on 10/02/2019 and 10/10/2019, validated the data and prepared the report.

3.2 Equipment

Figure: Equipment installed as part of the Sewer Flow Monitoring Study

Figure: Web-Enabled Flo-Dar® AV Sensor, Radar-Based Velocity/Area Flow Meter

3.2.1 SPECIFICATIONS

- **Enclosure**
 - o IP68 Waterproof rating, Polystyrene
- **Dimensions**
 - o 160.5 W x 432.2 L x 297 D mm (6.32 x 16.66 x 11.7 in.),
 - o With SVS, D = 387 mm (15.2 in.)
- **Weight**
 - o 4.8 kg (10.5 lbs.)
- **Operating Temperature**
 - o -10 to 50°C (14 to 122°F)
- **Storage Temperature**
 - o -40 to 60°C (-40 to 140°F)
- **Power Requirements**
 - o Supplied by FL900 Flow Logger, Flo-Logger, or Flo-Station

- **Interconnecting Cable**
 - o Disconnect available at both sensor and logger or Flo-Station
 - o Polyurethane, 0.400 (± 0.015) in. diameter; IP68
 - o Standard length 9 m (30 ft), maximum 305 m (1000 ft)
- **Cables – available in two styles:**
 - o Connectors at both ends
 - o Connector from sensor with open leads to desiccant hub, desiccant hub with connector to logger. A potting/sealant kit will be included. This can be used to run the cable through conduit.
- **Certification**
 - o Certified to: FCC Part 15.245: FCC ID: VIC-FLODAR24
 - o Industry Canada Spec. RSS210. v7: IC No.: 6149A-FLODAR24

SURCHARGE DEPTH MEASUREMENT

- o Auto zero function maintains zero error below 0.5 cm (0.2 in.)
- **Method**
 - o Piezo-resistive pressure transducer with stainless steel diaphragm
- **Range**
 - o 3.5 m (138 in.), overpressure rating 2.5 x full scale

VELOCITY MEASUREMENT

- **Method**
 - o Radar
- **Range**
 - o 0.23 to 6.10 m/s (0.75 to 20 ft/s)
- **Frequency Range**
 - o 24.075 to 24.175 GHz, 15.2 mW (max.)
- **Accuracy**
 - o $\pm 0.5\%$; ± 0.03 m/s (± 0.1 ft/s)

DEPTH MEASUREMENT

- **Method**
 - o Ultrasonic
- **Standard Operating Range from Flo-Dar® Housing to Liquid**
 - o 0 to 152.4 cm (0 to 60 in.)
- **Optional Extended Level Operating Range from Transducer Face to Liquid**
 - o 0 to 6.1 m (0 to 20 ft.) with 43.18 cm (17 in.) dead band, temperature compensated.
- **Accuracy**
 - o $\pm 1\%$; ± 0.25 cm (± 0.1 in.)

FLOW MEASUREMENT

- **Method**
 - o Based on Continuity Equation
- **Accuracy**
 - o $\pm 5\%$ of reading typical where flow is in a channel with uniform flow conditions and is not surcharged, $\pm 1\%$ full scale max.

SURCHARGE CONDITIONS DEPTH/VELOCITY DEPTH (Std with Flo-Dar® Sensor)

- **Surcharge depth supplied by Flo-Dar® sensor.**

VELOCITY (Optional Surcharge Velocity Sensor)

- **Method**
 - o Electromagnetic
- **Range**
 - o ± 4.8 m/s (± 16 ft/s)
- **Accuracy**
 - o ± 0.15 ft/s or 4% of reading, whichever is greater.
- **Zero Stability**
 - o ± 0.05 ft/s

The Flo-Dar® Open Channel Flow Meters provide an innovative approach to open channel flow monitoring. Combining digital Doppler radar velocity sensing with ultrasonic pulse echo level sensing, Flo-Dar® provides accurate open channel flow monitoring without the fouling problems associated with submerged sensors.

3.2.2 Perfect Solution for Difficult Flow Conditions:

- Flows with High Solids Content
- High Temperature Flows
- Caustic Flows
- Large Man-Made Channel
- High Velocities
- Shallow Flows

3.3 Benefits

- 3.3.1 Personnel have no contact with the flow during installation.
- 3.3.2 Maintenance caused by sensor fouling is eliminated.
- 3.3.3 Field Replaceable / Interchangeable Sensors and Monitors

3.4 How It Works

Flo-Dar® transmits a digital Doppler radar beam that interacts with the fluid and reflects back signals at a different frequency than that which was transmitted. These reflected signals are compared with the transmitted frequency. The resulting frequency shift provides an accurate measure of the velocity. Level is detected by ultrasonic pulse echo. Flow is then calculated based on the Continuity Equation:

$$Q = V \times A, \text{ Where } Q = \text{Flow}, V = \text{Average Velocity and } A = \text{Area}$$

3.5 Accurate Flow Measurements

Flo-Dar® provides the user with highly accurate flow measurements under a wide range of flows and site conditions. By measuring the velocity of the fluid from above, Flo-Dar® eliminates accuracy problems inherent with submerged sensors including sensor disturbances, high solids content and distribution of reflectors.

Understanding the Flo-DarTM Flow Measuring System

Independent tests verify non-contact flowmeter is highly accurate under both open channel and surcharge conditions

Flo-Dar is the only non-contact open channel velocity/area type flow meter available for measurement of flows in municipal wastewater and storm water sewers. Flo-Dar consists of a radar-based velocity measurement system and an ultrasonic-based pulse echo depth measurement system.

Flo-Dar has an optional surcharge velocity sensor (electromagnetic type) and depth sensor (pressure transducer) that provides the continuation of accurate flow data where intermittent, surcharged flow conditions are experienced.

Flo-Dar combines the information from the velocity and depth systems along with site specific data (pipe size, pipe shape, velocity profile) and provides the user with highly accurate, reliable flow data under a wide range of flow velocities and depths. Since the radar velocity sensor and the ultrasonic depth sensor cease to provide useful data when submerged, Flo-Dar has an optional surcharge velocity sensor (electromagnetic type) and depth sensor (pressure transducer) that provides for the continuous measurement of accurate flow data where intermittent, surcharged flow conditions are experienced.

The data system merges the data from these two independent flow systems and provides the user with a single flow signal that accurately represents flow over a range from a dry pipe to extreme surcharge conditions. Accuracy tests performed at Alden Research Labs have shown that the Flo-Dar is highly accurate under both open channel and surcharge (submerged) conditions.

Accuracy tests performed at Alden Research Labs have shown that the Flo-Dar is highly accurate under both open channel and surcharge (submerged) conditions.

Measurement of Flow Under Free Flow, Non-submerged Conditions

Open Channel Velocity

Open channel flow is any flow in a channel that has a free surface. Flo-Dar measures open channel flow as depicted in Figure 1. The radar velocity sensor measures flow in a manner similar to how radar guns measure the velocity of a baseball or an automobile.

Marsh-McBirney has developed and patented a process that yields an accurate determination of the average velocity from the measurement of the surface velocity at a known point on the flow surface.

Factors that influence the accuracy and stability of the measured surface velocity signal:

1. *Transmitted Frequency*
2. *Speed of Microwaves in Air*
3. *Angle of Microwave Beam*
4. *Calculation of Mean Velocity*

A radar “horn” contained inside of the watertight housing transmits a microwave beam through the housing at a defined angle to the flow surface. Disturbances on the surface reflect some of the microwaves back to the horn. The frequency of these returning microwave signals have been shifted (the Doppler effect) by an amount directly proportional to the speed of the moving surface. This frequency shift is detected and measured by the Flo-Dar flow meter and the data is stored as a measure of the surface velocity.

Since the accurate measurement of open channel flow requires the accurate determination of the average velocity of the flow stream, the measured surface velocity must be dynamically modified to obtain an accurate average velocity for use in the Continuity Equation, $Q = V_{av} \times A$. Marsh-McBirney has developed and patented a process that yields an accurate determination of the average velocity from the measurement of the surface velocity at a known point on the flow surface.

If one analyzes each of the four factors that influence the accuracy and stability of the measured surface velocity signal, it becomes obvious that a Doppler Radar based velocity sensor is very accurate and stable:

1. Transmitted Frequency - The transmitted frequency of 24.175 GHz is controlled to an accuracy of $\pm 0.065\%$
2. Speed of Microwaves in Air - Essentially constant at the speed of light
3. Angle of Microwave Beam - The sensor is placed in a rigid mount that is positioned parallel to the water surface (i.e. nearly level). The sensor can be removed from the mount and reinstalled while easily maintaining its original mounting location.
4. Calculation of Average Velocity—The relationship between the sensed (surface) velocity and the average velocity varies with pipe size and water depth.

Figure 1

By applying algorithms developed through basic hydraulic principles and from actual flow data taken at Alden Labs and at various customer sites, the surface velocity is transformed into an accurate representation of the mean velocity.

Since the location of the sensing region on the flow surface is known, the repeatability of the surface velocity measurement is excellent and its relationship to the mean velocity is very predictable.

Since the location of the sensing region on the flow surface is known, the repeatability of the surface velocity measurement is excellent and its relationship to the mean velocity is predictable.

Figures 2a, 2b, 2c and 2d depict the relationship that exists between various velocity contours and the mean velocity at different depth/Diameter ratios. Note that the velocity gradients that exist throughout the flow cross section are generally represented at the flow's surface - essentially creating a "finger-print" of the velocity contours that exist beneath the surface.

As one might expect, the velocities near the wall are less than the mean velocity and those near the surface are greater than the mean velocity. Since a) the radar sensor measures surface velocity at a known location on the flow surface, and b) these various surface velocities have known relationships to the mean velocity, then the mean velocity can be reliably and accurately calculated.

The accuracy of the calculated average velocity, after correction, is typically between 2% to 5%.

Note that the velocities present on the surface are typically within 10% of the average velocity. The accuracy of the calculated mean velocity, after correction, is typically between 2% to 5%. (See Note 1.)

Ultrasonic Pulse Echo Depth Measurement

Ultrasonic pulse echo depth sensors operate by energizing a piezoelectric transducer with an electronic pulse. This pulse creates an ultrasonic pulse of energy that travels to the flow surface where a portion of the energy returns to the transducer.

The transit time to the flow surface and back is recorded and the distance calculated by knowing the speed of sound at the site which has been corrected by an embedded temperature sensor. The accuracy of the depth measurement is 1%, +/- 0.1 inch .

Measurement of Flow Under Submerged Conditions

Electromagnetic (EM) Surge Velocity Sensor

As stated previously, the radar based velocity sensor measures the surface velocity of the flowing stream by detecting the average speed of the surface irregularities. When the radar sensor becomes totally submerged, it becomes "blind" and is no longer capable of measuring the fluid velocity.

Figures 2a, 2b, 2c and 2d depict the relationship that exists between various velocity contours and the mean velocity at different **depth/Diameter** ratios. Note that the velocity gradients that exist throughout the flow cross section are generally represented at the flow's surface—essentially creating a “finger-print” of the velocity contours that exist beneath the surface.

Figure 2a:
 $d/D = 0.10$

Figure 2b:
 $d/D = 0.25$

Figure 2c:
 $d/D = 0.50$

Figure 2d:
 $d/D = 0.75$

To allow for the uninterrupted measurement of flow under conditions that change from open channel flow to submerged flow as experienced in sewers that surcharge, Marsh-McBirney has added an additional surcharge velocity sensor. Placed on the underside of the standard Flo-Dar sensor, this electromagnetic sensor becomes active when the flow level rises to within four inches of the Radar horn and remains activated until the flow once again falls beneath that depth.

To allow for the uninterrupted measurement of flow under conditions that change from open channel flow to submerged flow as experienced in sewers that surcharge, Marsh-McBirney has added an additional surcharge velocity sensor.

Placed on the underside of the standard Flo-Dar sensor, this electromagnetic sensor becomes active when the flow level rises to within 4 inches of the Radar horn and remains activated until the flow once again falls beneath that depth.

The optional surcharge velocity sensor is based on the Faraday Principle of Electromagnetic Induction. This is the same well-proven principle that “full bore” or “spool-piece” magmeters utilize, the most widely used method of measuring wastewater flow in full pipes.

In the Marsh-McBirney design, an electromagnet embedded within the streamlined sensor generates a magnetic field in the flowing stream. The flow of the water passing through this magnetic field generates voltages in the water that are directly proportional to the speed of the water passing the sensor. Marsh-McBirney uses an in-house 120 foot long towing basin for calibration of electromagnetic sensors. Tow carriage accuracy is better than $\pm 0.5\%$.

Surcharge Depth Sensor

Once submerged conditions exist, the ultrasonic depth sensor ceases to provide useful depth information. To measure depth of the flow during surcharge conditions, a pressure transducer embedded in the Flo-Dar sensor is used in the system.

The location of the surcharge velocity sensor relative to the crown of the pipe is shown in Figure 3. This location provides sensing of the velocity stream just below the crown of the pipe where the flow exits the upstream piping. Empirical data, verified by independent tests at Alden Labs in Holden, Massachusetts indicate that the velocity measured at this location, when multiplied by 0.9, is typically equal to the average velocity.

Laboratory Tests

In September 2002 Marsh-McBirney contracted Alden Research Labs of Holden, Massachusetts to perform flow accuracy tests on the Flo-Dar sensor with an electromagnetic surcharge sensor. The Flo-Dar was subjected to a flow range of 400 gpm to over 9000 gpm in a pipe size of 23.5 inches. The pipe had a slope of approximately zero. The test results are shown in Figure 4, Figure 5, Figure 6 and Figure 7.

The flow tests showed that the Flo-Dar compared very favorably with the Alden flow standard (weigh tank) over a wide range of flows where the open channel flow ranged from 400 gpm to 6000 gpm, and the surcharge (submerged) flow ranged from 6000 gpm to 9000 gpm.

The flow tests showed that the Flo-Dar compared very favorably with the Alden flow standard (weigh tank) over a wide range of flows where the open channel flow ranged from 400 gpm to 6000 gpm, and the surcharge (submerged) flow ranged from 6000 gpm to 9000 gpm.

Tests were also run to depict how Flo-Dar performs under transition conditions where the flow goes from an open channel condition to a surcharge (submerged) condition.

Test results show that the data from the open channel radar sensor and surcharge electromagnetic sensor overlay each other and the Alden Standard. Tests were run under both free flow conditions as well as where the pipe outlet was partially blocked so as to create an entirely different velocity/depth relationship.

Additional flow accuracy tests were run on a 36" pipe at Alden on July 17, 2003. All of the data points were shown to be within 3.5% of the Alden Standard.

Figure 4 compares the Flo-Dar flow vs. the Alden Standard (weigh tank). The flow condition for this test was both open channel flow and surcharge (submerged) flow.

Test results show that the data from the open channel radar sensor and surcharge electromagnetic sensor overlay each other and the Alden Standard.

Figure 5 compares the velocity measured by the Radar sensor plotted against flow depth. Note that when the depth reaches approximately 18 inches the EM surcharge sensor has been activated. There is one data point where both sensors are active and then the EM surcharge sensor continues to measure after the radar sensor has become submerged and inoperative.

Figure 6 depicts a second surcharge test where the flow was incremented more slowly in order to achieve additional data points in the area where both the Radar sensor and the EM surcharge sensors are active simultaneously. Note that both the Radar sensor and the EM sensor are active between flow depths of 18 inches and 18.5 inches. Also, note how both the Radar and EM data points overlay each other and the Alden standard.

The accuracy of Flo-Dar under both open channel conditions as well as surcharge (submerged) conditions is more than adequate for the most demanding of metering applications including open channel billing applications.

Figure 7 depicts the result of a surcharge test at a lower flow rate. In this test, a round plate with multiple holes was placed at the outlet of the test pipe so as to achieve submerged flow at a lower velocity. Note the consistency of both the Radar velocity data and the EM velocity data as compared to the Alden standard.

Additional tests performed at Alden in 2003 on a 36" pipe again validated Flo-Dar's accuracy under open channel and surcharge flow.

Figure 8 compares the Flo-Dar flow vs. the Alden Standard (weigh tank) for flow accuracy tests in a 36" pipe. These tests were performed on July 17, 2003. Note that at 17,000 gpm the sensor was under surcharge conditions. All of the data points were shown to be within 3.5% of the Alden Standard.

Flo-Dar measures open channel velocity and depth by non-contact means virtually eliminating the need to periodically clean the sensors as required by all submerged type sensors.

Data recovery from Flo-Dar deployments ranges between 98% to 100% even under site conditions that render most submerged sensors inoperable.

The Flo-Dar data logger records all four of the flow parameters - open channel surface velocity and depth, and surcharged velocity and depth. When the water depth is below the bottom of the Flo-Dar sensor, only the surface velocity and the flow depth of the open channel flow are used in the flow calculation.

Once the flow depth is such that both the surcharge depth sensor is activated and a conductivity switch is activated, then flow is calculated using the full pipe dimensions for area and the surcharge velocity sensor for velocity.

Conclusions

Flo-Dar is a rugged, general purpose flow meter for use in most open channels such as sanitary sewers, storm water sewers and other man-made channels such as aqueducts as well as certain natural channels such as small streams. Flo-Dar measures open channel velocity and depth by non-contact means virtually eliminating the need to periodically clean the sensors as required by all submerged type sensors. Data recovery from Flo-Dar deployments ranges between 98% to 100% even under site conditions that render most submerged sensors inoperable.

The accuracy of Flo-Dar under both open channel conditions as well as surcharge (submerged) conditions is more than adequate for the most demanding of metering applications including open channel billing applications.

Note 1. The accuracy of open channel flow meters can be affected by adverse conditions present at any metering site. The accuracy specifications of most manufacturers are generally stated under ideal conditions.

Key Information	15

1) Locate the following parts (See Figure 1):

- | | |
|--------------------------------|---|
| 1) Flo-Dar Sensor | 7) Extension Pipe, Tee Fitting, and Bushing |
| 2) Flo-Dar Logger | 8) Clamp Set with qty. (8) 1/4-20 Bolts |
| 3) Flo-Dar Communication Cable | 9) Desiccant Capsule |
| 4) Flo-Ware Software CD | 10) Laser-Alignment Tool |
| 5) Sensor Mounting Frame | 11) Installation & Operations Manual |
| 6) Jack-Bar Assembly | 12) Start-Up Guide (not pictured) |

Figure 1

Methods & Procedures

2) Flo-Ware Software Configuration.

1. Insert the “Flo-Ware For Windows Resources CD” into your drive.
2. Select (single-click) “floware4.exe” from the “Software” box on your screen.
3. Select “Save” from the “File Download—Security Warning” screen.
4. Select “Save” from the “Save As” screen.
5. Select “Run” from the “Download Complete” screen.
6. Select “Run” from the “Internet Explorer—Security Warning” screen.
7. An installation wizard will initiate and load the files onto your hard drive.
8. Select the language you want to use from the “Select Language” screen.
9. Select “Next” from the “Welcome” screen.
10. Select “Next” from the “Choose Destination Location” screen.
11. Select “Next” from the “Select Components” screen.
12. Select “Next” from the “Start Installation” screen.
13. Select “Finish” from the “Installation Complete” screen.
14. Scroll down the screen and find “Flo-Dar / SVS” on the left side of the screen. Select (single-click) “flodar.exe” from that box on your screen
15. Select “Run” from the “File Download—Security Warning” screen.
16. Select “Run” from the “Internet Explorer—Security Warning” screen.
17. An installation wizard will initiate and install the files onto your hard drive.
18. Select “Finish” from the “Flo-Dar / SVS File Driver Installation” screen.

NOTE: There are ample help files on the “Flo-Ware for Windows Resources CD”

3) Set up the mounting frame and jack-bar assembly.

- A) Install the jack-bar assembly in the manhole. As a general rule, the jack-bar should be approximately 20” to 24” above the crown (top) of the pipe. In order to reduce movement of the jack-bar due to the cantilever action of the sensor, the jack-bar should be located as parallel to the pipe and invert of the manhole as possible.

MOST Desirable Jack-Bar Mount

LEAST Desirable Jack-Bar Mount

B) Assemble the frame, clamp-set, bushing, tee, and extension as shown in figure 2. Position the frame as close as possible to the lip of the pipe by sliding the assembly along the jack-bar with the slide. Be sure to secure the set-screw.

Figure 2

C) Set the elevation of the frame (measured to the top of the frame tubes) to be 6" above the inside crown of the pipe (for pipe I.D. under 25") or 5" above the inside crown of the pipe (for pipe I.D. of 25" and greater). An easy way to set the frame elevation is to measure the distance from the bottom of the manhole invert to the top of the mounting frame tubes. (This assumes that there is no drop or hydraulic jump from the lip of the pipe to the invert) Set the dimension to equal the pipe I.D. plus 6" (for pipe I.D. under 25") or the pipe I.D. plus 5" (for pipe I.D. of 25" or greater).

Figure 3

D) If you are not interested in measuring flow under surcharge conditions, or if you are sure the site will not surcharge, you can mount the sensor at any elevation above the surface of the water as long as the frame is within 60" of the water surface. When the sensor is mounted at higher elevations than those shown in Figure 3, it will still read normal velocity and level readings. Surcharge level will still be recorded properly, but surcharge velocity readings will not be possible. If you are mounting the sensor at higher elevations, it is still necessary to confirm the location of the velocity radar beam as described on pages 5 & 6 of this guide.

- E) Align and level the frame by placing the laser alignment tool in the frame as shown in figure 4. Utilize the bubble-level on the tool to level the frame.

Figure 4

- F) Snap the laser-pointer into the laser alignment tool as shown below in figure 5. It is a tight fit. Make sure the pointer is firmly and evenly seated in its slot as shown.

Figure 5

- G) With the laser-pointer snapped into the tool, as shown, place the alignment tool back into the frame. The laser is now set up to duplicate the velocity radar beam angle. Use the laser-pointer to shine the beam onto the surface of the water. Ideally, the beam should be aligned so that it lands in the middle of the surface of the water inside the pipe.

NOTE: There are numerous adjustment points on the frame and jack-bar assembly.

- H) Remove the laser-pointer from the tool and re-install it into the tool as shown below in figure 6. With the laser-pointer in the position shown, it is now set up to duplicate the ultra-sonic level transducer beam location.
- I) Align the beam so that it lands in the middle of the channel you are measuring.

NOTE: You may have to check level, velocity laser alignment, and level laser alignment several times to ensure all three are correct. Adjusting one or more of the alignments will often affect one or more of the other adjustments! It is critical to remember to tighten all bolts on the jack-bar and clamp set to assure that the sensor frame does not move, once positioned correctly.

Figure 6

4) Install the Sensor.

- A) Gently lower the sensor into the mounting frame and lock it in place by rotating the bail assembly (located on top of the sensor) 90 degrees. The two locking arms will extend out to engage the slots in the vertical side webs of the frame ensuring that the sensor will not dislodge from the frame, particularly if the manhole surcharges.

NOTE: Make sure the sensor is placed in the frame so that the cables are exiting the sensor on the downstream (manhole effluent) side. (see Figure 7 below)

5) Connect the Data Logger.

- A) Connect the sensor cables to the data logger. Make sure the grey cable-end connects to the connector marked grey. Connect the yellow cable-end to the connector marked yellow. Tighten the threaded cable connector-ends securely to the data logger connectors.
- B) Remove the desiccant capsule from the vacuum-sealed bag and plug it onto the brass A.P.R. fitting (located next to the yellow cable connector) on the data logger. See Figure 8 below.

Figure 7

Figure 8

6) Configure the Data Logger using Flo-Ware Software.

A) Connect the interface cable from the data logger to the laptop's 9-pin serial port.

NOTE: If your laptop does not have a 9-pin serial port, you will have to use a USB port with a USB-to-serial port adapter (not provided by Marsh-McBirney).

B) Double-click the "Flo-Ware" icon on your computer's desktop.

C) When Flo-Ware opens, you will see the screen shown below.

D) Place your cursor on the line that says "Communicate with an instrument" and single-click. A small pop-up window will open. Place your cursor over the "Flo-Dar" line and single-click. A second pop-up window will appear. Single-click on the word "communications". The site set-up screen will appear as shown below.

The screenshot shows the 'Site Setup' dialog box. It has a tabbed interface with 'Site Setup' selected. The dialog is divided into several sections. The top section has buttons for 'Save Site', 'Delete Site', 'Read Setup', and 'Send Setup'. Below these are input fields for 'Site ID' (a dropdown), 'Location' (a text field), 'Cycle Time' (15 min), 'Samples' (1 per cycle), 'Flow Unit' (MGD), and 'Start Type' (Immediate). The middle section has a 'Multiplier' field (1.00) and a 'Calc...' button. The right section has 'Memory' (Fixed), 'Shape' (Circular), 'Diameter' (10.00 in), 'Sediment' (0.00 in), 'Sensor Offset' (12.00 in), and a 'Calc...' button. Below these is an 'Extended Setup' dropdown and an 'S/N' field. The bottom section is a table for 'Channels' with columns 'Name', 'Logging', and 'Unit'. The table contains rows for 'Velocity' (On, Feet Per Second), 'Level' (On, Inches), 'Temperature' (Off, Celsius), and 'Surcharge Level' (Off, Inches). At the bottom are 'User' and 'Quality Control' fields, and 'OK' and 'Cancel' buttons. On the far right, it shows 'File Driver Ver. 3.1.0.0' and 'Firmware Ver.'.

- E) Proceed to enter your specific site information into the appropriate boxes in the site set-up screen. An example of a typical set-up is shown below, along with explanations-actions of the input required from the user.

The screenshot shows the 'Communications - Flo-Dar' window with the 'Site Setup' tab selected. The window contains the following elements:

- Buttons:** Save Site, Delete Site, Read Setup, Send Setup, Calc... (next to Sensor Offset), Calc... (next to Multiplier), OK, and Cancel.
- Fields:**
 - Site ID: Manhole #15 (dropdown)
 - Location: Elm Street (text box), Anytown, USA (text box)
 - Cycle Time: 15 min (text box)
 - Samples: 1 per cycle (text box)
 - Flow Unit: MGD (dropdown)
 - Start Type: Immediate (dropdown)
 - Memory: Fixed (dropdown)
 - Shape: Circular (dropdown)
 - Diameter: 24.00 in (text box)
 - Sediment: 0.00 in (text box)
 - Sensor Offset: 30.00 in (text box)
 - Multiplier: 1.00 (text box)
- Channels Table:**

Name	Logging	Unit
Velocity	On	Feet Per Second
Level	On	Inches
Temperature	Off	Celsius
Surcharge Level	Off	Inches
- Other:** An 'Extended Setup' button is visible below the Sensor Offset field. On the right side, there are labels for 'File Driver Ver. 3.1.0.0' and 'Firmware Ver.'.

- Site I.D. and Location are self-explanatory. You **MUST** enter something in the site I.D. box in order for the program to work.
- Cycle time is the time interval between the start of each sample.
- Number of samples is the number of 1-minute samples that the instrument will take at the beginning of each cycle.
- Flow Units can be selected by using the pull-down arrow to view the available choices.
- Start Type is either immediate or delayed. If you choose a delayed start, you can use the pull-down arrow to reveal a calendar box and time box. You can use the pull down arrow on the calendar box to view convenient calendars which allow you to click on the date you desire. When using a delayed start, the instrument will “sleep” until the desired start-up date and time are reached. It will then “wake up” and start sampling.
- Multiplier should be left at 1.00 for most applications in round pipes. If you have a round pipe greater than 54” in diameter, or you are using the instrument in a square/rectangular channel, or an odd-shaped channel, contact the Customer Support Department at 714-542-1004 for instructions about the multiplier.
- Memory can be either “Fixed” or “Wrapped”. If you choose “Fixed”, the instrument will stop collecting data once the memory is full. In “Wrapped” mode, when the memory becomes full, the instrument will continue collecting data and will over-write the first data point, then the second, etc., with new data. This will continue indefinitely until a new set-up is downloaded to the instrument.

- Shape is self-explanatory. If you are measuring flow in an odd-shaped conduit, please call the US3 at 714-542-1004 for detailed instructions.
- Diameter is the INSIDE diameter of the pipe. This dimension should be measured in the field. Often, the pipe diameter is not what one assumes from the specs on a given pipe. Always measure the inside diameter to be sure of the dimension.
- Sediment is the amount of non-flowing sediment that may be in the bottom of the pipe. The software will take sediment into account when calculating cross-sectional area for the flow calculation. If there is no sediment, leave the number at 0.00.
- Sensor offset is the dimension from the top surface of the horizontal sensor mounting frame tubing, to the bottom of the invert or channel. (see Figure 3, page 4) If you want to measure flow in a surcharge condition, or if you want to set the instrument up to measure flow in case the manhole surcharges, then the mounting frame should be located so that the sensor offset dimension is equal to the pipe diameter plus 6 inches for pipe diameters up to 24", or equal to the pipe diameter plus 5 inches for pipe diameters greater than 24".
- Single-click on the "Extended Setup" button.
- Single-click on "Surcharge Level Cal"
- A window marked "Calculate Surcharge Level Cal will appear as shown below.

- Type 0.00 in the box marked "known".
- Single-click on the "Take Sample" box.
- Allow the unit to perform a real time sample of the surcharge pressure transducer. This will take approx. 45 seconds. The software will fill in the box marked "Sensor" and the box marked "Level Cal" with the proper values automatically.

- 7) Save the site information to your hard drive by clicking on the “Save Site” button near the upper left-hand corner of the set-up screen.
- 8) Download the site information to the data logger by clicking on the “Send Setup” button near the upper right-hand corner of the site set-up screen.

- 9) Turn on (check the boxes) both of the SVS channels as shown above.
- 10) Adjust the instrument clock to match your laptop computer clock as shown below. Use the pull-downs next to the date and time to help you set the instrument clock time. Click OK.

- 11) A warning screen will appear as shown below. Select whether or not you want to reset the logger flow totalizer, then click OK.

- 12) The “Send setup complete” screen (shown below) will appear, indicating that you have successfully sent the setup data to the instrument. The instrument will now begin collecting data.

13) Collect real-time readings to confirm proper operation of the instrument before leaving the metering site.

A) Single-click on the “Real Time” tab on the Communications Screen. The real time screen will appear as shown below.

B) Single-click on the “Sample” button. You may or may not see the following pop up window appear.

- C) Single-click the “Sample” button. It will take about 45 to 60 seconds for the meter to sample velocity, level, and send the data packet to the data logger. It will then display the real time sample on the screen (see below).

- D) Confirm the level reading on the screen matches the actual water level in the pipe.
Confirm that the velocity reading on the screen matches the velocity you approximate in the pipe.

- 14) Close the real time window and Flo-Ware main screen.
- 15) Disconnect the communications cable from your laptop to the data logger.
- 16) Screw the protective metal cap onto the communications port connector.
in order to protect the connector from damage due to water or dirt.
- 17) Coil the sensor cables and secure them to the top ladder rung. Hang the data logger from the top ladder rung. (See Figure 9 next page.)

Figure 9

You have successfully installed the Flo-Dar Flowmeter. Please remember to secure the manhole lid prior to leaving the site.

If you have any questions regarding this flowmeter, please contact US3. Please note that telephone support is available Monday through Friday between 9:00 AM and 5:00 PM U.S. Pacific Standard Time.

Marsh-McBirney FLO-DAR® Area/Velocity Radar Flow Meter Sensor

FLOW

The Flo-Dar Sensor provides an ideal solution for non-contact, maintenance-free portable or permanent sewer flow monitoring.

Features and Benefits

The Flo-Dar Area/Velocity Radar Flow Meter provides a revolutionary approach to open channel flow monitoring. The sensor combines advanced Digital Doppler Radar velocity sensing technology with ultrasonic pulse echo depth sensing to remotely measure open channel flow. Use with FL900 Series Flow Logger or Flo-Logger/Logger XT for portable monitoring; for permanent monitoring sites, the Flo-Dar can be connected to the Flo-Station which displays flow rate, velocity, and level. (See Lit. No. 2709 [standard] or Lit. No. 2711 [wireless] for Flow Logger product information, or Lit. No. 2616 for Flo-Station product information). Intrinsically safe models available.

Accurate Flow Measurement

Flo-Dar provides the user with highly accurate flow measurements under a wide range of flows and site conditions. By measuring the velocity of the fluid from above, Flo-Dar eliminates accuracy problems inherent with submerged sensors including sensor disturbances, high solids content and distribution of reflectors.

Non-Contact Sensor Eliminates Lost Data

No lost data with non-contact, above the flow sensor that is unaffected by fouling due to debris and grease.

Easy Installation and Maintenance

As the sensor is mounted above the flow, personnel have little or no contact with the flow during installation. Future sensor removal can be done without the need for confined space entry.

Independent Accuracy / Long-Term Stability Verification

Flo-Dar sensor accuracy and long-term stability (up to 3 years without need for site calibration) from low flow depths up to surcharge conditions has been independently verified

many times over the years including a formal evaluation by the Alden Research Laboratory, Inc. and recent field evaluations done by municipalities and consulting engineering firms.

Perfect Solution for Difficult Flow Conditions

Operates in the most difficult conditions including flows with high solids content, high temperature, shallow and caustic flows, large man-made channels, and high velocities up to 20 ft/s.

Optional Surcharge Velocity Sensor

During surcharge events Flo-Dar's optional electromagnetic sensor will continue to provide uninterrupted and accurate flow monitoring through dry and wet weather flows without the need for routine sensor cleaning or maintenance.

Applications

Municipal

- Sanitary Sewer Evaluation Studies
- Collection Systems
- Capacity Studies
- Combined Sewer Overflows
- Inflow and Infiltration (I&I) Studies
- Billing / Custody Transfer
- Plant Influent and Effluent

Industrial

- Process Waste
- Plant Influent
- Plant Effluent
- Non-contact Cooling Water
- Stormwater Monitoring and Compliance

DW = drinking water WW = wastewater municipal PW = pure water / power
IW = industrial water E = environmental C = collections FB = food and beverage

Be Right™

Specifications*

FLO-DAR SENSOR

Enclosure

IP68 Waterproof rating, Polystyrene

Dimensions

160.5 W x 432.2 L x 297 D mm (6.32 x 16.66 x 11.7 in.), with SVS, D = 387 mm (15.2 in.)

Weight

4.8 kg (10.5 lbs.)

Operating Temperature

-10 to 50°C (14 to 122°F)

Storage Temperature

-40 to 60°C (-40 to 140°F)

Power Requirements

Supplied by FL900 Flow Logger, Flo-Logger, or Flo-Station

Interconnecting Cable

–Disconnectable at both sensor and logger or Flo-Station

Polyurethane, 0.400 (±0.015) in. diameter; IP68
Standard length 9M (30 ft), maximum 305 m (1000 ft)

Cables are available in two styles:

–connectors both ends
–connector from sensor with open leads to desiccant hub, desiccant hub with connector to logger. A potting/sealant kit will be included. This can be used to run the cable through conduit.

Important Note: The sensor cable assembly with desiccant hub is compatible with either the Marsh-McBirney Flo-Logger/Logger XT or the Hach FL900 Series Flow Loggers. When using this cable assembly with the Marsh-McBirney Flo-Logger, do not disconnect the desiccant cartridge that is attached to the Flo-Logger itself. It is important to keep the air tube plugged.

If using Flo-Dar cable with Flo-Station, the cable will have bare leads to the Flo-Station (30 to 1000 ft. lengths) and there will be no desiccant hub, as the air tube terminates inside of the Flo-Station housing.

Warranty

1 year

Set-up/Data Retrieval

Flo-Ware for Windows software is the user on-site set-up, data management, and report generation software. It is compatible with desktop/laptop computers utilizing Windows operating system.

Certification

The Flo-Dar Transmitter is certified to the following requirements:

- Transmitter type: Field Disturbance Sensor
- Frequency: 24.125 GHz - Doppler pulse
- Maximum rated power output: 128 dbuV (ave) @ 3 meters

Certified to: FCC Part 15.245: FCC ID: VIC-FLODAR24
Industry Canada Spec. RSS210. v7: IC No.: 6149A-FLODAR24

Use of this device is subject to the following conditions:

1. There are no used serviceable items inside this device.
2. The user must install this device in accordance with the supplied installation instructions and must not modify the device in any manner whatsoever.
3. Any service involving the transmitter must only be performed by Hach Company.
4. The user must ensure that no one is within 20 cm of the face of the transmitter when operating.

SURCHARGE DEPTH MEASUREMENT

Auto zero function maintains zero error below 0.5 cm (0.2 in.)

Method

Piezo-resistive pressure transducer with stainless steel diaphragm

Range

3.5 m (138 in.), overpressure rating 2.5 x full scale

VELOCITY MEASUREMENT

Method

Radar

Range

0.23 to 6.10 m/s (0.75 to 20 ft/s)

Frequency Range

24.075 to 24.175 G-Hz, 15.2mW (max.)

Accuracy

±0.5%; ±0.03 m/s (±0.1 ft/s)

DEPTH MEASUREMENT

Method

Ultrasonic

Standard Operating Range from Flo-Dar Housing to Liquid

0 to 152.4 cm (0 to 60 in.)

Optional Extended Level Operating Range from Transducer Face to Liquid

0 to 6.1 m (0 to 20 ft.) with 43.18 cm (17 in.) dead band, temperature compensated.

Accuracy

±1%; ±0.25 cm (±0.1 in.)

FLOW MEASUREMENT

Method

Based on Continuity Equation

Accuracy

±5% of reading typical where flow is in a channel with uniform flow conditions and is not surcharged, ±1% full scale max.

SURCHARGE CONDITIONS DEPTH/VELOCITY

DEPTH (Std with Flo-Dar Sensor)

Surcharge depth supplied by Flo-Dar sensor.

VELOCITY (Optional Surcharge Velocity Sensor)

Method

Electromagnetic

Range

±4.8 m/s (±16 ft/s)

Accuracy

±0.15 ft/s or 4% of reading, whichever is greater.

Zero Stability

> ±0.05 ft/s

CERTIFICATION INTRINSICALLY SAFE

The Flo-Dar and Surcharge Velocity Sensors are certified to Class I, Zone 1 Standards. They conform to ANSI/UL 60079-11 and are certified to CAN/CSA E60079-11 and EN 60079-11 standards.

The Flo-Dar sensor meets CE requirements.

Engineering Specifications

1. The flow meter shall be capable of measuring level, average velocity and surcharge depth.
2. The method of velocity measurement shall be Doppler radar.
3. The sensor shall combine advanced Doppler Radar velocity sensing technology with ultrasonic pulse echo depth sensing to remotely measure open channel flow.
4. Flow shall be calculated based on the Continuity Equation ($Q=V \times A$), where Q =Flow, V =Average Velocity and A =Area.
5. The range of velocity measurement shall be 0.23 to 6.10 m/s (0.75 to 20 ft/s).
6. The method of depth measurement shall be ultrasonic.
7. The standard operating range for depth measurement shall be 0 to 152.4 cm (0 to 60 in.) with an optional operating range of 0 to 6.1 m (0 to 20 ft.) with 43.18 cm (17 in.) deadband, temperature compensated.
8. The flow meter shall have a surcharge condition velocity sensor option.
9. Exterior dimensions of the sensor shall not exceed 160.5 W x 432.2 L x 297 D mm (6.32 W x 16.66 L x 11.7 D in.) or 160.5 W x 432.2 L x 387 D mm (6.32 W x 16.66 L x 15.2 D in.) with Surcharge Velocity option.
10. The sensor shall be able to measure bi-directional surcharge flow.
11. Optional Intrinsically Safe models available for flow monitoring in hazardous locations.
12. The model shall be the Marsh-McBirney Flo-Dar Open Channel Flow Meter Sensor.

Dimensions

Flo-Dar Area/Velocity Radar Flow Meter

The desiccant hub assembly includes a junction box to connect sensor cable to the desiccant and subsequently to the FL900 Logger. The desiccant can easily be replaced without need to purchase a separate desiccant module.

*Desiccant Hub Assemblies for use with portable FL900 Series Loggers and Flo-Logger.
(Sensor cable for use with Flo-Station will not contain a desiccant hub and will have bare wires on cable end.)*

Ordering Information

Configure FLO-DAR Sensor to Logger (Portable)

Flo-Dar Sensor	Model 4000	—	4	X	X
Flo-Dar Sensor with specified cable length (need to add cable as separate line item)			4		
Non Intrinsically Safe Surcharge Velocity Sensor Option (IMPORTANT NOTE: SVS cable length MUST MATCH FloDar Sensor Cable length)				0 3	
Non Extended Range Extended Range Option —Allows use in flow depths up to 18 feet. Allow for 18" deadband. Standard unit max depth is 60". SVS Option requires Remote Extended Range below. Hach FL900 Series Cellular Wireless Flow Logger

FLOW

NEW!

When combined with the Flo-Dar or Flo-Tote 3 sensor, the Hach FL900 Series Wireless Flow Logger takes flow monitoring to a whole new level. With features that reduce site time and increase crew safety, the wireless flow monitoring system allows you to easily manage your flow data 24/7, as well as your budget.

WW

Features and Benefits

The FL900 Wireless Flow Logger provides users with a reliable, budget saving open channel wireless flow monitoring solution for open portable flow monitoring applications. Flow data is accessible 24/7 with Hach fsDATA web-based software. When combined with the Flo-Dar or Flo-Tote 3 sensor, the system will drastically reduce site time and increase safety for monitoring crews.

Increase Monitoring Crew Safety

With the time saving features designed into the FL900 Wireless Flow Loggers, crews spend less time in the manhole and less time on site to decrease monitoring costs while increasing the safety of flow monitoring crews.

Plug and Play Sensor Ports

The FL900 Series Flow Logger is available with 1, 2 or 4 sensor ports. The sensor ports are "plug and play"; the logger auto-detects the type of sensor connected (Flo-Dar, Surcharge Velocity Sensor or Flo-Tote 3) to allow customers maximum flexibility for their Hach flow sensor inventories.

Flow Monitoring Data at Your Fingertips with fsDATA™ Web-Based Software

Hach fsDATA web-based flow meter software is the ideal time-saving and economical solution for the management of your Hach wireless flow meters and data 24/7. With

fsDATA routine site visits to collect flow data are eliminated keeping flow monitoring crews safe. (See Lit. No. 2707 for additional information on fsDATA.)

Easy Installation/Versatile Mounting Options

The logger can be quickly attached to a wall, pole or manhole ladder in minutes. Users can choose to hang logger from standard carabiner or optional 4-bolt wall mount for pole, horizontal or vertical wall mount or ladder rung mount.

LED Gives Quick Confirmation of Logger Status

Get peace of mind the logger is ready to capture the next flow event, before you leave the site. The rugged FL900 Wireless Flow Logger includes a status LED panel. The indicator light on the top of the logger shows the status of the instrument and modem (if equipped with wireless option). The user can manually send a call to the server to make sure the network connection is good by simply swiping the magnet over the call initiation target.

Specifications*

FL900 SERIES FLOW LOGGER PORTABLE DC POWERED ELECTRONICS (Includes Models FL901, FL902 & FL904)

Dimensions (W x D x H)

25.4 x 22 x 40 cm (10.0 x 8.7 x 16.0 in.)

Enclosure

PC/ABS structural foam

Environmental Rating

NEMA 6P (IP68)

Weight (Using Model FL900)

4.5 kg (10 lb)—no batteries; 6.3 kg (14 lb)—2 batteries;
8.2 kg (18 lb)—4 batteries

Operating Temperature

–18 to 60°C (0 to 140°F) at 95% RH

Storage Temperature

–40 to 60°C (–40 to 140°F)

Power Requirements

8 to 18 Vdc from batteries or external power source,
2.5W max.

Battery Life at 15 minute logging intervals (at room temperature)

185 days with 4 lantern batteries and a Flo-Dar sensor,
306 days with 4 lantern batteries and a Flo-Tote sensor

The optional long life alkaline battery pack can be used to extend battery life, if the Flow Logger is ordered with the external power option connector.

LED Status Indicator

- Green Flashes every 3 seconds during normal operation.
Flashes every 15 seconds during sleep mode.
- Red Flashes when an attached sensor does not agree with the logger program, when an expected sensor is not found or the sensor is not working properly.

LED Modem Indicator

- Stays green during a call to the server. Goes blank after the call is successfully completed and terminated.
- Flashes red if the call to the server failed.

Sensor Ports

1, 2 or 4 ports

Connectors

Stainless steel connectors

Datalog Channels

16 maximum

Alarms

Maximum of 16 channel alarms including high/high, high, low, low/low and system alarms including low battery, low RTC battery, low slate memory, slate memory full.

Alarm Actions

Trigger sampler, change logging interval, change call interval, send an e-mail, or send text message (SMS).

Logging Intervals

1, 2, 3, 4, 5, 6, 10, 12, 15, 20, 30 or 60 minutes
Primary and secondary intervals for dynamic logging.

Data Storage

Event Log: 1,000 events maximum in non-volatile flash memory
Sample History: 2,000 sample events maximum in non-volatile flash memory
Datalog: 325,000 data points; 1128 days for 3 channels at 15-minute log intervals

Local Communication

USB

RS232 (Baud rates: 9600, 19200, 38400, 57600, 115200)

Remote Communication (optional)

Wireless modem; CDMA or GPRS technology with a mobile provider, CDMA2000 1xRTT or GPRS.

Protocols

Modbus RTU; Modbus ASCII; Mobile-Terminated SMS;
Mobile-Originated SMS; TCP/IP

Timebase Accuracy

±0.002%, synchronized every 24 hours with server software and modem

Supported Sensors

Flo-Tote 3, Flo-Dar, Flo-Dar with SVS, Rain Gauge

Sampler Interface

Compatible with Sigma 900 Standard, Sigma 900 Max, Hach SD900 to support set-point sampling, flow- pacing, and logging sample history.

Desktop Software

Flo-Ware for Windows software is required for programming the logger, data management, and report generation software. It is compatible with desktop/lap top computers utilizing Windows operating system. Minimum resolution needed is 1024x768.

Internet Application Software

FSDATA web-based software for flow meter data management and report generation for wireless flow meters and data access 24/7.

Certifications

Logger: CE; optional AC power supply: UL/CSA/CE

Warranty

1 year

The FL900 Series Loggers meet CE requirements.

*Specifications subject to change without notice.

Engineering Specifications

1. Exterior dimensions of the Flow Logger shall be 25.4 W x 22 D x 40 cm H (10.0 W x 8.7 D x 16.0 in. H)
2. The Flow Logger enclosure material shall be PC/ABS structural foam with NEMA 6P (IP68) rating.
3. The operating temperature for the Flow Logger shall be -18 to 60°C (0 to 140°F) at 95% relative humidity and storage temperature of -40 to 60°C (-40 to 140°F).
4. Power requirements of the Flow Logger shall be 8 to 18 Vdc from batteries or external power source, 2.5W max.
5. When used with a Flo-Dar sensor, the Flow Logger shall have a battery life of 185 days utilizing 4 6v alkaline batteries at a 15 minute logging interval (at room temp.). When used with a Flo-Tote sensor, the Flow Logger shall have a battery life of 306 days utilizing 4 6v alkaline batteries at a 15 minute logging interval (at room temperature). A long-life battery for longer deployments shall be available option.
6. The Flow Logger shall have 1, 2 or 4 sensor ports with stainless steel connector, 1 communications port and 1 auxiliary port.
7. The Flow Logger shall have primary logging intervals of 1, 2, 3, 4, 5, 6, 10, 12, 15, 20, 30 or 60 minutes.
8. The Flow Logger shall have secondary logging intervals available to modify the logging rate based on a defined channel alarm condition or trigger.
9. Optional remote communication shall be available on the FL900 Series Loggers via Wireless modem; CDMA2000 1xRTT or GPRS.
10. The Flow Logger data storage event log shall be 1,000 events maximum in non-volatile flash memory.
11. Timebase Accuracy of the Flow Logger shall be 0.002% synchronized every 24 hours with server software and modem.
12. The Flow Logger shall support the Flo-Dar, Flo-Dar with SVS, Flo-Tote 3 Sensors and Rain Gauge.
13. The Flow Logger shall be compatible with Sigma 900 Standard, Sigma 900 Max and Hach SD900 to support set point sampling, flow-pacing and sample history logging.
14. The Flow Logger shall be able to connect to a lap top or desk top PC using either USB or RS232 serial connection.
15. The Flow Logger shall have an LED indicator for operating /programming status visible on the topmost horizontal surface of the logger.
16. The internet data management software shall indicate sites in alarm condition in either a map view or list view.
17. When connected to an external power source, the FL900 series logger shall be capable of power switching, i.e. drawing power from the external source and conserving the alkaline batteries inside the logger base. At the time the external power source reaches a low alarm condition, it will then switch the power draw to the alkaline batteries mounted inside the base of the logger.
18. The internet software for flow data management shall be Hach FSDATA.
19. The logger will be a Hach FL901, FL902, or FL904 Flow Logger.

Be Right™

User Instructions

Antennas for flow products

Precautionary labels

Read all labels and tags attached to the instrument. Personal injury or damage to the instrument could occur if not observed.

Electrical equipment marked with this symbol may not be disposed of in European public disposal systems after 12 August of 2005. In conformity with European local and national regulations (EU Directive 2002/98/EC), European electrical equipment users must now return old or end-of-life equipment to the Producer for disposal at no charge to the user.

Note: For return for recycling, please contact the equipment producer or supplier for instructions on how to return end-of-life equipment, producer-supplied electrical accessories, and all auxiliary items for proper disposal.

Product components

Make sure that all components have been received. If any items are missing or damaged, contact the manufacturer or a sales representative immediately.

Required equipment/software

Make sure that the following requirements are available:

- FL900 Series flow logger with modem option or Sigma 930T
- Remote host computer operating FSDATA or Telogers for Windows server software
- Portable computer operating FSDATA, FloWare or Telogers for Windows
- Activated wireless account

FL900 Series Flow Logger

Verify the telemetry (wireless option)

The user can manually send a call to the server to make sure that the network communication is good.

1. Temporarily attach the antenna to the logger to test the antenna and the cell coverage at the site location before installation.
2. Touch the magnet to the call initiation target ([Figure 1](#)). The modem LED indicator changes to green.
3. Look at the modem LED indicator during the call (45 to 90 seconds) and wait for a change:
 - LED goes off—the connection to the server is good.
 - LED flashes red—the connection to the server failed.

Note: If the connection failed, refer to the instrument user manual for more information.

Figure 1 Call the server

1 Call initiation target

2 Magnet

930T Flow meter

Verify the wireless connection

The tamper button is used to examine if the wireless connection is working.

1. Temporarily attach the antenna to the logger to test the antenna and the cell coverage at the site location before installation.
2. Attach the tamper module to the RS232 connector on the flow meter ([Figure 2](#)).
3. Push the tamper button to start a cellular call from the flow meter to the remote host computer.
4. Go to the event log in Telogers for Windows to make sure that the data was successfully downloaded from the flow meter to the remote host computer. Refer to the 930T documentation for further information about telemetry troubleshooting.

Figure 2 Tamper module connected to the 930T Flow meter

1 RS232 connector

2 Tamper module

Installation

⚠ WARNING

Electromagnetic radiation hazard. To meet the requirements of the FCC Grant, CE Mark and other regulatory bodies, do not use or install the device with an antenna that is not supplied by the manufacturer. Make sure that all antennas are kept at a minimum distance of 20 cm (7.9 in.) from all personnel in normal use.

NOTICE

Test the antenna and cell coverage at the site location before installation.

NOTICE

Make sure that the flow meter is programmed to call the host PC before installation.

Half wave antenna

NOTICE

The half wave antenna is intended for above-ground use.

1. Unpack the antenna ([Figure 3](#)).
2. Bend the antenna at the joint to a 90 degree angle between the antenna and the swivel fitting.
3. Put the antenna extension inside of the logger handle ([Figure 4](#)).
4. Align the threads from the antenna fitting to the antenna receptacle on the logger. Hand-tighten by turning the swivel end.

Figure 3 Half wave antenna

Figure 4 Half wave antenna attached

Traffic rated manhole lid antenna

Required tools:

- 31.75 mm (1¼ in.) open-end wrench
- Large nylon Ty-wrap cable ties

1. Unpack the antenna ([Figure 5](#)) or disassemble the antenna from the instrument.
2. Make sure that the manhole lid has a 25.4 mm (1 in.) hole for the antenna neck to fit into.
***Note:** Do not use the pick hole. Use a drill, motor oil for lubrication and increasing size drill bits to drill the 25.4 mm (1 in.) hole if needed. Make sure that the location of the hole does not coincide with the ribs on the underside of the manhole lid.*
3. Remove the manhole lid and put the lid in a stable position where the lid top and bottom are accessible.
4. Remove the nut and washers from the threaded neck on the base of the antenna ([Figure 6](#)).
5. Put the antenna cable and neck through a hole on the manhole lid until the base of the antenna is against the top of the manhole lid.
6. Install the flat washer, then the lock washer and then the nut on to the threaded neck of the antenna.
7. Tighten the nut with the open-end wrench until both washers are flush against the base of the manhole lid and the antenna is tight ([Figure 6](#)).
8. Connect the antenna cable to the instrument connector labeled "Antenna". To make sure proper transmission, hand-tighten the connections.
9. Attach any excess cable to the access ladder or another non-obstructing location with Ty-wrap cable ties.
10. Replace the manhole lid.

Figure 5 Traffic rated manhole lid antenna

Figure 6 Manhole lid installation

1 Antenna top	5 Antenna cable
2 Manhole lid	6 Antenna threaded neck
3 Flat washer	7 Lock washer
4 31.75 mm (1¼ in.) nut	

Wing Quad antenna

The Wing Quad antenna can be attached to an interior wall or to a window for a longer term deployment or the antenna can be attached to a manhole lid for a short term deployment.

Required tools:

- Large nylon Ty-wrap cable ties

1. Unpack the antenna ([Figure 7](#)).
2. To attach the antenna to a window or a wall, remove the adhesive backing and push the antenna to a clean surface.
3. To attach the antenna to a manhole, make sure that the manhole lid has a hole large enough for the antenna connector to fit into.
Note: Do not use the pick hole. Use a drill, motor oil for lubrication and increasing size drill bits to drill the 1" hole if needed. Make sure that the location of the hole does not coincide with the ribs on the underside of the manhole lid.
4. Remove the manhole lid and put the lid in a stable position where the lid top and bottom are accessible.
5. Put the antenna cable and neck through a hole on the manhole lid until the base of the antenna is against the top of the manhole lid.
6. Attach the antenna to the manhole lid with heavy tape or tar tape.
7. Connect the antenna cable to the instrument connector labeled "Antenna". To make sure proper transmission, hand-tighten the connections.
8. Attach any excess cable to the access ladder or another non-obstructing location with Ty-wrap cable ties.
9. Replace the manhole lid.

Figure 7 Wing Quad antenna

Traffic rated in-road/burial antenna

Required tools:

- Asphalt saw or auger: saw capable of cutting 127 mm (5 in.) in diameter and 76.2 mm (3 in.) deep into a road surface or ground
- Asphalt chisel
- Hammer drill with 19.1 to 25.4 mm ($\frac{3}{4}$ to 1 in.) asphalt drill bit (for antenna cable installation)
- Sakrete asphalt mix (Asphalt patch)
- Bondo; Mar-Hyde P606 Traffic Detector Wire Loop Sealer or equal
- Shovel, if placing in the ground

The traffic rated in-road/burial antenna is intended for burial beneath the road surface or ground adjacent to a manhole or vault that is being monitored ([Figure 9](#)).

NOTICE

The antenna should be installed in the road approximately 152.4 to 203.2 mm (6 to 8 in.) inches from the manhole or vault containing the flow meter.

1. Unpack the antenna ([Figure 8](#)) or disassemble the antenna from the instrument.
2. Excavate a hole or trench in the road surface or ground approximately 127 mm (5 in.) in diameter (or square) and 76.2 mm (3 in.) deep.
3. Select the closest position from the excavated hole to the manhole. Drill a 19.1 to 25.4 mm ($\frac{3}{4}$ to 1 in.) hole from the selected position to the manhole. Make sure to drill the hole below the steel manhole cover support ring ([Figure 9](#), [List item](#) on page 7).
4. Put the antenna cable through the drill hole into the manhole or vault.
5. Install the antenna in the excavated hole. Pull the antenna cable taut. Locate the antenna so that the ceramic side of the antenna is approximately 6.4 ($\frac{1}{4}$ in.) to 12.7 mm ($\frac{1}{2}$ in.) maximum below the road or ground surface. Make sure the antenna sits safely in the hole.
6. Attach the antenna cable to the antenna connector.
7. Make sure that the antenna is working by placing a call from the instrument (refer to [Verify the wireless connection](#) on page 2).
8. When the operation of the antenna is confirmed, permanently bury the antenna.
 - a. Insert asphalt mix around the antenna and pack it in place. Make sure the antenna is sitting firmly on a solid base and cannot be rocked back and forth.
 - b. Install the asphalt mix around the antenna. The mix should be level with the road surface but not over the antenna surface.
 - c. Pour the Bondo sealer on and over the asphalt mix and over the top of the antenna. There should be no more than 6.4 mm ($\frac{1}{4}$ in.) of Bondo sealer over the top of the antenna.

- d. Connect the desired sensors and options to the flow meter. Calibrate the sensors and install the flow meter in the manhole.

Tab 4: DVD with Raw Flow Monitoring Data

Tab 5: US³ Company Information

US³ is a California Corporation **Federal ID No. 33-0729605** and qualifies as a Minority Business Enterprise. US³ has certified as an MBE with the California Public Utility Commission's authorized clearinghouse, **Verification Number: 97ES0008**.

US³ is a specialty service company for the Water & Waste Water industry, providing monitoring and control for Utilities since 1996. US³ is in the forefront of this industry by taking the proven technological approaches developed in other high-tech industries and applying them to protect one of our most precious natural resources - our water.

US³ engineers and technical personnel have applied advanced instrumentation system technology to water/wastewater open channel flow monitoring, pipeline evaluation, engineering, and data analysis, all coupled to the power of the Internet. This unique integrated systems approach allows the company to bring greater insight and intelligence to gathering information about water/wastewater system performance of our clients, and in turn, to support the fulfillment of their commitments to manage and cost effectively design, operate, and maintain these systems.

Figure: US³ utilizes exclusively Hach March-McBirney Flo-Dar® Meters

Moreover, **US³** supports Municipalities, Consulting Engineering firms and other water/waste water systems integrators by providing temporary technical services for engineering, software programming and technical site maintenance and calibration site support work, primarily in the Water and Waste Water industries.

Figure: All technicians are certified for Confined Space Entry.

Preliminary Hydrology Memo

DATE: November 11, 2019

TO: City of Brea

FR: R.A. Smith

CC:

RE: Brea Mall Expansion Preliminary H & H Report

Section 1 – Project Description

The proposed redevelopment is located at 1065 Brea Mall, in Brea California. The property is bound by Randolph Avenue to the west, E Birch Street to the north, State College Boulevard to the East, and Imperial Highway to the south. The existing site was previously developed and the project is proposing demolition of the existing Sears Building and associated pedestrian access. Additionally, the existing A.C. Parking lot is proposed to be demolished. The existing utilities servicing the Sears Building are proposed to be removed, and utilities that are passing through the existing parking lot are proposed to be re-routed adjacent to the proposed redevelopment.

The proposed redevelopment has both a residential and retail component. The westernmost building is a multi-level building with 310 proposed residential dwelling units. On the first ground level of this building there are proposed retail/restaurant tenants. The northern portion of the building is designated as a residential parking structure and will provide parking for residents only. This building also contains a loading dock on the north side of the building adjacent to the ring road.

The proposed building located in the Southwest Corner of the redevelopment is a proposed Fitness Center including an outdoor pool area. The fitness center is serviced by an existing at-grade loading dock to the east of the building.

The proposed buildings on the easterly side of the redevelopment consist of a Sporting Goods Store on the upper level, and retail/restaurants on the lower level. There is a proposed parking structure at the Southeast Corner of the development that is provided for customers/employees only. There will be ingress/egress provided at the lower level, and 2nd level. There is a proposed loading dock located on the upper level for service to the Sporting Goods/Retail/Restaurant. These proposed buildings will abut and connect to the existing mall.

The existing ring road will be reconfigured with a new A.C. Pavement ring road that provides vehicular access to the proposed residential parking structure, retail parking structure, and proposed loading docks. It is anticipated that the existing ring road south of the redevelopment will be utilized for new utilities and/or utility re-routing. As such, there will be new A.C. Pavement within these trenching locations, and the existing ring road will be milled and overlaid to match the existing grades.

There is a proposed Paseo containing hardscape, softscape, and landscaping between the new buildings. This area will provide a place for pedestrians to lounge, walk and provides access between the different uses.

On the easterly side of the project site, east of the proposed Sporting Goods Store, the existing parking lot on the upper level will be reconfigured with a new A.C. Pavement Parking lot and access road to the retail parking structure.

New Utility services (electrical, gas, water, fire, sanitary sewer, storm roof drains) will be provided to each proposed building. Two new ADS Chamber systems are proposed for water quality treatment and hydromodification.

The disturbed area of the project site is approximately 742,265 sf. Because of the improvements to the existing ring road it is not feasible to capture and treat the entirety of the disturbed area. Instead, a portion of the existing parking lot run-on (97,336sf) will be treated in lieu of the disturbed area (57,680sf) which follows existing drainage patterns.

There will be proposed landscaping on the project site within the parking lot areas, and the paseo. However, at this time the quantity of landscaping/pervious areas has not been determined. For the purposes of this report it is conservatively assumed that the entirety of the proposed redevelopment is 100% impervious.

See Existing Hydrology Map in in Attachment 2 and Proposed Hydrology Map in Attachment 3.

A summary of the Hydrologic Areas are provided below:

Existing Hydrologic Area						
Identification	Area (sf)	Area (ac)	Pervious Area (sf)	Pervious Area (ac)	Impervious Area (sf)	Impervious Area (ac)
1-West	485,060	11.14	34,214	0.79	450,846	10.35
2-East	290,483	6.67	13,068	0.30	277,415	6.37
Total	775,543	17.80	47,282	1.09	728,261	16.72
Proposed Hydrologic Area

Section 2 – Hydrology Requirements

This H & H Report is provided to show that the project will satisfy the following hydrology requirements outlined by the Orange County Hydrology Manual and Technical Guidance Document for projects in North Orange County. The methodology discussed in the Orange County Hydrology Manual, and latest addendum, was used to satisfy the requirements below:

1. Hydromodification Requirements of the 2-year 24-hour storm event
 - Reduce Peak Runoff Volume to less than 5% increase of the pre-developed condition
 - Increase Time of Concentration to match the pre-developed condition
 - Reduce Peak Flows to less than 10% increase of the pre-developed condition
2. Hydrology/Hydraulic Analysis of existing and post-development peak 100-year storm flow rates, including mitigation measures to reduce peak flows to existing conditions
3. Hydrology/Hydraulic Analysis to ensure proposed storm drain system is designed to accommodate 100-year peak flows discharging from the project.

Section 3 – Hydromodification

See Section II.3 and Attachment 1 of the WQMP Report for Hydromodification Calculations and WinTR-55 Model Output. A Summary of results is provided below:

Runoff Volume (cf):

$$(V_{2\text{-yr},POST} / V_{2\text{-yr},PRE}) \leq 1.05$$

$$\text{Raw Data: } (117,754 \text{ cf} / 107,122 \text{ cf}) = 1.10 > 1.05$$

$$\text{Chamber \#1 Sizing} = 40,445 \text{ cf}$$

$$\text{Chamber \#2 Sizing} = 12,056 \text{ cf}$$

$$\text{Total retained on-site} = 52,501 \text{ cf}$$

$$\text{Actual Runoff Volume in Post-Condition} = 117,754 \text{ cf} - 52,501 \text{ cf} = 65,253 \text{ cf}$$

$$\text{Accounting for Chamber System: } (65,253 \text{ cf} / 107,122 \text{ cf}) = 0.61 < 1.05$$

Time of Concentration (hr):

$$(T_{c2\text{-yr},PRE} / T_{c2\text{-yr},POST}) = \leq 1.05$$

$$(0.100\text{hr} / 0.123\text{hr}) = 0.81 \leq 1.05$$

Peak Flow (cfs):

$$(Q_{2\text{-yr},POST} / Q_{2\text{-yr},PRE}) \leq 1.10$$

$$(23.99 \text{ cfs} / 23.10 \text{ cfs}) = 1.04 \leq 1.10$$

Section 4 – Hydrology/Hydraulic Analysis of pre vs. post 100-year Peak Flows

The hydrologic analysis was performed in accordance with the Orange County Rational Methodology outlined in the Orange County Hydrology Manual and its latest addendum. The addendum limits the initial drainage area to 300ft. As such, the time of concentration was assumed to be 5 minutes based on size and land use of predominately paved and impervious sub areas. The rainfall intensity was determined from the appropriate intensity-duration-frequency (IDF) curve for the particular area of study. Orange County uses different IDF curves based depending on whether the location is a mountainous or non-mountainous region. Since this site is below 2,000 in elevation the main precipitation intensities for non-mountainous areas was used. Figure B-3 from the Orange County Hydrology Manual was used for finding the intensities. The Fp used is 0.25 for Soil Group C soils. See applicable Sections from the Hydrology Manual in Attachment 1 of this Report.

As shown in the Proposed Hydrology Exhibit (Attachment 3) the proposed site contains a series of new storm drain infrastructure. Each pipe run corresponds to a travel time (Tt) which results in a higher time of concentration and a lower intensity. The Manning's Equation was used to calculate the velocity within each pipe. (Note that at this time the full hydraulic analysis of each pipe run is not included in this Report as this is a Preliminary Study).

Manning Equation:

$$Q = VA \quad V = \frac{k}{n} \left(\frac{A}{P} \right)^{2/3} S^{1/2}$$

Where k = 1.49

A = Flow Area of the Pipe (sf)

P = Wetted Perimeter (ft)

Q = Discharge Flow Rate (cfs)

S = Slope (ft/ft)

V = Velocity (ft/s)

The travel time can be found by dividing the pipe length by the velocity and multiplying the value by 60 to get the travel time in minutes:

$$Tt \text{ (min)} = [\text{pipe length (ft)}] / [\text{velocity (ft/s)} * 60 \text{ (sec/min)}]$$

In addition to reducing the peak flows another important aspect of the design is to size the storm drain pipes to accommodate the runoff from the 100-year peak flows. Using the Manning's Equation above, the peak flows (Q) for the 100-year storm were calculated for each proposed drainage area. The pipes were sized for a capacity to bypass the 100-year peak flows whilst maintaining a minimum velocity of 2.0 ft/s.

Hydraulic Calculations were performed using a spreadsheet based on the Hydrology Manual and Methodology as discussed above. The results are depicted in (Attachment 4) and as summarized below:

Pre-Development				
Rational Analysis	Coefficient, C	Intensity (in/hr)	Area (ac)	Q100 (cfs)
Area 1 - West	0.84	5.38	11.14	50.15
Area 2 -East	0.86	6.19	6.67	35.46
Existing Combined Flows to Public Storm Drain				85.61
Post-Development				
Rational Analysis	Coefficient, C	Intensity (in/hr)	Area (ac)	Q100 (cfs)
DMA #1	0.90	4.77	13.72	58.85
DMA #2	0.90	6.17	4.09	22.70
Proposed Combined Flows to Public Storm Drain				81.55

As depicted above and in Attachment 4 the flows to the storm drain system are less in the redeveloped condition than the existing. Note that the redeveloped condition is also assuming 100% impervious area, and has not taken into account the additional storage volume provided by the proposed Chamber System.

Section 5 – Bypass Flows

As shown in the Existing Hydrology Exhibit (HYD-01), there are two existing storm drain pipes that run through the project site and discharge near the Randolph Avenue Driveway. The pipe heading south (running westerly of the existing Nordstrom Parking Structure) is an 18" RCP pipe running at a slope of 2.00%. The pipe running in a southwesterly direction is a 36" RCP pipe sloping at 0.25%. Using the Manning's Equation (with an N Value of 0.013) the existing pipes have a capacity of 14.90cfs, and 33.43cfs, respectively. This yields a total capacity of approximately 48.33cfs in the existing condition.

Because of the location of the proposed buildings these two pipes are proposed to be re-routed and/or upsized. The existing 36" pipe is proposed to be re-routed through the new ring road alignment, where the new pipe will pickup the existing 18" pipe. The new 36" pipe will follow the alignment of the existing 18" pipe running southerly just west of the proposed Residential Building. The new pipe is 36" HDPE. Using the Manning's Equation (with an N Value of 0.009) the proposed bypass pipe has a capacity of 61.09cfs. As such, the capacity of the proposed storm drain bypass system exceeds the existing storm drain system that is in place, and will not adversely impact the redevelopment.

Attachment 1 – Orange County Hydrology Manual Exhibits

Regression Equations: $I(t) = at^b$
 (I= Intensity in inches/hour, t= duration in minutes)

Return Frequency (years)	a	b
2	5.702	-0.574

ORANGE COUNTY
 HYDROLOGY MANUAL

**MEAN PRECIPITATION
 INTENSITIES FOR
 NONMOUNTAINOUS AREAS**

C.6.4. Estimation of Maximum Loss Rates for Pervious Areas, F_p

Table C.2 lists the maximum loss rates (inch/hour), F_p , for pervious area as a function of soil group.

TABLE C.2.
MAXIMUM EFFECTIVE PERVIOUS AREA LOSS RATES (inch/hour), F_p

<u>SOIL GROUP:</u>	<u>A</u>	<u>B</u>	<u>C</u>	<u>D</u>
F_p :	0.40	0.30	0.25	0.20

Table C.2 reflects the model calibration assuming an F_p of 0.30 in/hr. for all the considered catchments and storm return frequencies. This mean value of F_p of 0.30 in/hr. was assigned to Hydrologic Soil Group B due to the actual average soil conditions in the reconstitution study areas. The F_p values for Hydrologic Soil Groups A, C, and D, were assigned to account for the different soil types that may be found in Orange County.

C.6.5. Estimation of Catchment Maximum Loss Rates, F_m

The maximum loss rate selected from Table C.2 applies to the pervious area fraction of the watershed. The loss rate assumed for an impervious surface is 0.0 inch/hour. The maximum loss rate, F_m , for a catchment is therefore given by

$$F_m = a_p F_p \quad (C.7)$$

where a_p is the pervious area fraction and F_p is the maximum loss rate for the pervious area (Section C.6.4).

Should a catchment contain several F_m values, the composite F_m value is determined as a simple area average of the several F_m values.

ORANGE COUNTY
HYDROLOGY MANUAL

**TIME OF CONCENTRATION
NOMOGRAPH
FOR INITIAL SUBAREA**

It is noted that the T_c computation procedure is based upon the summation of an initial subarea time of concentration with the several travel times estimated by normal depth flow-velocities through subsequent subareas.

D.4. INTENSITY-DURATION CURVES

The precipitation intensity-duration curves presented in Section B.3 (Figures B-3 and B-4) are appropriate for the rational method.

D.5. RUNOFF COEFFICIENT

The runoff coefficient (C) is the ratio of rate of runoff to the rate of rainfall at an average intensity (I) when the total drainage area is contributing. The selection of the runoff coefficient depends on rainfall intensity, soil infiltration rate (F_p), and impervious and pervious area fractions (a_i and a_p).

Since one acre-inch/hour is equal to 1.008 cfs, the rational formula is generally assumed to estimate a peak flowrate in cfs. Runoff coefficient curves are developed using the relationship:

$$C = \begin{cases} 0.90 \left(a_i + \frac{(I - F_p)a_p}{I} \right), & \text{for } I \text{ greater than } F_p \\ 0.90 a_i, & \text{for } I \text{ less than or equal to } F_p \end{cases} \quad (D.3)$$

where the proportion factor of 0.90 is a calibration constant determined by an average fit between the rational method and design storm unit hydrograph (see Section E) peak flow rate estimates, and where

- C = runoff coefficient
- I = rainfall intensity (inches/hour)
- F_p = infiltration rate for pervious areas (inches/hour)
(see Section C.6.4)
- a_i = ratio of impervious area to total area (decimal fraction)
- a_p = ratio of pervious area to total area (decimal fraction), ($a_p = 1 - a_i$)

RATIONAL METHOD

D.1. RATIONAL METHOD EQUATION

The rational method was originally developed to estimate runoff from small (less than one square mile) urban and developed areas and its use shall be limited to those conditions. Basically, the rational method equation relates rainfall intensity, a runoff coefficient, and drainage area size to the direct peak runoff from the drainage area. This relationship is expressed by the equation:

$$Q = CIA \quad (D.1)$$

where

- Q = the runoff in cubic feet per second (cfs) from a given area
- C = a runoff coefficient representing the ratio of runoff to rainfall
- I = the time-averaged rainfall intensity in inches per hour corresponding to the time of concentration
- A = drainage area (acres)

When the flow is concentrated in curb and gutters, drainage channels or conduits, the flow velocity may be estimated by the well-known Manning's equation

$$V = \frac{1.49}{n} \quad R^{2/3} S^{1/2} \quad (D.2)$$

where

- V = mean velocity (fps)
- n = Manning coefficient of roughness (see Design Manual)
- R = hydraulic radius (feet)
- S = energy slope which equals the conduit invert slope for uniform flow

The travel time will then be the flow distance divided by the velocity of flow.

This Preliminary Water Quality Management Plan (WQMP) has been prepared for Simon Property Group by R.A. Smith, Inc. The WQMP is intended to comply with the requirements of the County of Orange NPDES Stormwater Program requiring the preparation of the plan.

The undersigned, while it owns the subject property, is responsible for the implementation of the provisions of this plan, including the ongoing operation and maintenance of all best management practices (BMPs), and will ensure that this plan is amended as appropriate to reflect up-to-date conditions on the site consistent with the current Orange County Drainage Area Management Plan (DAMP) and the intent of the non-point source NPDES Permit for Waste Discharge Requirements for the County of Orange, Orange County Flood Control District and the incorporated Cities of Orange County within the Santa Ana Region. Once the undersigned transfers its interest in the property, its successors-in-interest shall bear the aforementioned responsibility to implement and amend the WQMP. An appropriate number of approved and signed copies of this document shall be available on the subject site in perpetuity.

Section I Permit(s) and Water Quality Conditions of Approval or Issuance

Provide discretionary or grading/building permit information and water quality conditions of approval, or permit issuance, applied to the project. If conditions are unknown, please request applicable conditions from staff. *Refer to Section 2.1 in the Technical Guidance Document (TGD) available on the OC Planning website (ocplanning.net).*

Project Information	
Permit/ Application No. (If applicable)	PR 19-04
Grading or Building Permit No. (If applicable)	
Address of Project Site (or Tract Map and Lot Number if no address) and APN	1065 Brea Mall Brea, CA 92821 APN: 319-101-37
Water Quality Conditions of Approval or Issuance	
Water Quality Conditions of Approval or Issuance applied to this project. (Please list verbatim.)	Not Applicable
Conceptual WQMP	
Was a Conceptual Water Quality Management Plan previously approved for this project?	No – this Report serves as the Preliminary/Conceptual WQMP for the Project.

Watershed-Based Plan Conditions	
Provide applicable conditions from watershed - based plans including WIHMPs and TMDLS.	The receiving waters for the project site are Coyote Creek, San Gabriel River Reach 1, San Gabriel River Estuary, and San Pedro Bay. A WIHMP has been developed for the Coyote Creek-San Gabriel River Watershed and has been submitted to the Executive Officer for approval, but has not yet been approved. Coyote Creek TMDLS – Metals (Copper, Lead, Zinc) San Gabriel TMDLS – Metals (Copper, Lead, Zinc), Selenium

Section II Project Description

II.1 Project Description

Provide a detailed project description including:

- Project areas;
- Land uses;
- Land cover;
- Design elements;
- A general description not broken down by drainage management areas (DMAs).

Include attributes relevant to determining applicable source controls. *Refer to Section 2.2 in the Technical Guidance Document (TGD) for information that must be included in the project description.*

Description of Proposed Project	
Development Category (From Model WQMP, Table 7.11-2; or -3):	• Restaurants where the land area of development is 5,000 square feet or more including parking area. This category is defined as facilities that sell prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC code 5812). • Parking lots 5,000 square feet or more including associated drive aisle, and potentially exposed to urban stormwater runoff. A parking lot is defined as a land area or facility for the temporary parking or storage of motor vehicles used personally, for business, or for commerce. • All significant redevelopment projects, where significant redevelopment is defined as the addition or replacement of 5,000 or more square feet of impervious surface on an already developed site. Redevelopment does not include routine maintenance activities that are conducted to maintain original line and grade, hydraulic capacity, original purpose of the facility, or emergency redevelopment activity required to protect public health and safety.

Project Area (ft²): 742,265	Number of Dwelling Units: 310		SIC Code: 5812, 5311	
Project Area	Pervious		Impervious	
	Area (acres or sq ft)	Percentage	Area (acres or sq ft)	Percentage
Pre-Project Conditions	40,600	5.5	701,665	94.5
Post-Project Conditions	0**	0.00**	742,265**	100.00%**
** At the time of this Preliminary WQMP the site plan areas (specifically the proposed landscape areas) have not been determined. For the sake of this report it is conservatively assumed that the entirety of the proposed redevelopment is 100% impervious.				
Drainage Patterns/Connections	In both the existing and proposed conditions there is essentially a lower level (westerly) and an upper level (easterly) that provide access to the different mall levels. The primary drainage pattern for the lower level is from Northeast to Southwest and the primary drainage patterns for the upper level is North to South. In the existing condition the lower level (west) sheet flows to existing storm drain inlets and discharges to the public storm drain within Randolph Avenue. The proposed project maintains the existing drainage patterns in that the runoff is captured via storm drain inlets, conveyed to the proposed ADS Chamber System for infiltration, and overflows to the public storm drain within Randolph Avenue. This Lower Level is considered DMA #1 for the purposes of this report. In the existing condition the upper level (east) sheet flows to existing storm drain inlets and discharges to the private storm drain adjacent to State College Boulevard within the inner ring road of the Mall. The runoff is then conveyed south of the existing Cheesecake Factory and conveyed west to the public storm drain with Randolph Avenue. The proposed project maintains the existing drainage patterns in that the runoff is captured via storm drain inlets, conveyed to the proposed ADS Chamber System for infiltration, and overflows to the same inlet as the existing project site.			

Narrative Project
Description:
(Use as much space as
necessary.)

The existing development consists of a portion of the existing Brea Mall including the existing Sears Department Store, A.C. Pavement parking lot, concrete sidewalk for pedestrian access, and existing utilities.

The Brea Mall Expansion Redevelopment is proposing to demolish the existing Sears Building and associated pedestrian access. Additionally, the existing A.C. Parking lot is proposed to be demolished. The existing utilities servicing the Sears Building are proposed to be removed, and utilities that are passing through the existing parking lot are proposed to be re-routed adjacent to the proposed redevelopment.

The proposed redevelopment has both a residential and retail component. The westernmost building is a multi-level building with 310 proposed residential dwelling units. On the first ground level of this building there are proposed retail/restaurant tenants. The northern portion of the building is designated as a residential parking structure and will provide parking for residents only. This building also contains a loading dock on the north side of the building adjacent to the ring road.

The proposed building located in the Southwest Corner of the redevelopment is a proposed Fitness Center including an outdoor pool area. The fitness center is serviced by an existing at-grade loading dock to the east of the building.

The proposed buildings on the easterly side of the redevelopment consist of a Sporting Goods Store on the upper level, and retail/restaurants on the lower level. There is a proposed parking structure at the Southeast Corner of the development that is provided for customers/employees only. There will be ingress/egress provided at the lower level, and 2nd level. There is a proposed loading dock located on the upper level for service to the Sporting Goods/Retail/Restaurant. These proposed buildings will abut and connect to the existing mall.

The existing ring road will be reconfigured with a new A.C. Pavement ring road that provides vehicular access to the proposed residential parking structure, retail parking structure, and proposed loading docks. It is anticipated that the existing ring road south of the redevelopment will be utilized for new utilities and/or utility re-routing. As such, there will be new A.C. Pavement within these trenching locations, and the existing ring road will be milled and overlaid to match the existing grades.

There is a proposed Paseo containing hardscape, softscape, and landscaping between the new buildings. This area will provide a place for pedestrians to lounge, walk and provides access between the different uses.

On the easterly side of the project site, east of the proposed Sporting Goods Store, the existing parking lot on the upper level will be reconfigured with a new A.C. Pavement Parking lot and access road to the retail parking structure.

New Utility services (electrical, gas, water, fire, sanitary sewer, storm roof drains) will be provided to each proposed building. Two new ADS Chamber systems are

proposed for water quality treatment and hydromodification.

11.2 Potential Stormwater Pollutants

Determine and list expected stormwater pollutants based on land uses and site activities. *Refer to Section 2.2.2 and Table 2.1 in the Technical Guidance Document (TGD) for guidance.*

Pollutants of Concern			
Pollutant	Check One for each: E=Expected to be of concern N=Not Expected to be of concern		Additional Information and Comments
Suspended-Solid/ Sediment	E ☒	N ☐	Residential Development, Commercial Development, Restaurants and uncovered parking lots

Trash and Debris	E ☒	N ☐	Residential Development, Commercial Development, Restaurants, parking lots

11.3 Hydrologic Conditions of Concern

Determine if streams located downstream from the project area are potentially susceptible to hydromodification impacts. *Refer to Section 2.2.3.1 in the Technical Guidance Document (TGD) for North Orange County or Section 2.2.3.2 for South Orange County.*

☐ No – Show map

☒ Yes – Describe applicable hydrologic conditions of concern below.

Per the Susceptibility Analysis performed by PACE, and Figure 1 “Susceptibility Analysis San Gabriel-Coyote Creek” in the TGD the project is located with a Potential Area of Erosion, Habitat, & Physical Structure Susceptibility.

Per Section 2.2.3.1 the project is required to:

- Reduce Post-development runoff volume for the 2-yr, 24-hr storm to less than 5 percent increase from the pre-development condition.
- Increase Post-development time of concentration to within 95% or greater than pre-development condition.

The methodology discussed in the Orange County Hydrology Manual (WinTR-55) was used to satisfy the requirements below:

- Reduce Peak Runoff Volume to less than 5% increase of the pre-developed condition
- Increase Time of Concentration to match the pre-developed condition
- Reduce Peak Flows to less than 10% increase of the pre-developed condition

See WinTR-55 Output in Attachment 1 herein. A summary of the results is provided below. See

Summary of Results

Hydromodification Summary			
2-yr, 24-hr Storm	Qpeak (cfs)	Runoff Volume (cf)	Time of Concentration (hr)
Pre-Development	23.10	107,122	0.100
Post-Development	23.99	117,754	0.123

Runoff Volume (cf):

$$(V_{2\text{-yr,POST}} / V_{2\text{-yr,PRE}}) \leq 1.05$$

$$\text{Raw Data: } (117,754 \text{ cf} / 107,122 \text{ cf}) = \mathbf{1.10 > 1.05}$$

$$\text{Chamber \#1 Sizing} = 40,445 \text{ cf}$$

$$\text{Chamber \#2 Sizing} = 12,056 \text{ cf}$$

$$\text{Total retained on-site} = 52,501 \text{ cf}$$

$$\text{Actual Runoff Volume in Post-Condition} = 117,754 \text{ cf} - 52,501 \text{ cf} = 65,253 \text{ cf}$$

$$\text{Accounting for Chamber System: } (65,253 \text{ cf} / 107,122 \text{ cf}) = \mathbf{0.61 < 1.05}$$

Time of Concentration (hr):

$$(T_{C_{2\text{-yr,PRE}}} / T_{C_{2\text{-yr,POST}}}) \leq 1.05$$

$$(0.100\text{hr} / 0.123\text{hr}) = \mathbf{0.81 \leq 1.05}$$

Peak Flow (cfs):

$$(Q_{2\text{-yr,POST}} / Q_{2\text{-yr,PRE}}) \leq 1.10$$

$$(23.99 \text{ cfs} / 23.10 \text{ cfs}) = \mathbf{1.04 \leq 1.10}$$

11.4 Post Development Drainage Characteristics

Describe post development drainage characteristics. *Refer to Section 2.2.4 in the Technical Guidance Document (TGD).*

In both the existing and proposed conditions there is essentially a lower level (westerly) and an upper level (easterly) that provide access to the different mall levels. The primary drainage pattern for the lower level is from Northeast to Southwest and the primary drainage patterns for the upper level is North to South.

In the existing condition the lower level (west) sheet flows to existing storm drain inlets and discharges to the public storm drain within Randolph Avenue. The proposed project maintains the existing drainage patterns in that the runoff is captured via storm drain inlets, conveyed to the proposed ADS Chamber System for infiltration, and overflows to the public storm drain within Randolph Avenue. This Lower Level is considered DMA #1 for the purposes of this report. See WQMP Exhibit in Section VI for reference.

In the existing condition the upper level (east) sheet flows to existing storm drain inlets and discharges to the private storm drain adjacent to State College Boulevard within the inner ring road of the Mall. The runoff is then conveyed south of the existing Cheesecake Factory and conveyed west to the public storm drain with Randolph Avenue. The proposed project maintains the existing drainage patterns in that the runoff is captured via storm drain inlets, conveyed to the proposed ADS Chamber System for infiltration, and overflows to the same inlet as the existing project site. As discussed above the runoff will be conveyed westerly via the private storm drain and connection to the existing public storm drain within Randolph Avenue, where it will join the overflow runoff from DMA #1.

From the public storm drain system within Randolph the stormwater runoff will be conveyed to the receiving waters for the project:

- Coyote Creek
- San Gabriel River Reach 1
- San Gabriel River Estuary
- San Pedro Bay

II.5 Property Ownership/Management

Describe property ownership/management. *Refer to Section 2.2.5 in the Technical Guidance Document (TGD).*

The affected properties are owned by Simon Property Group. BMP Maintenance and Management will be provided by Simon Property Group. There will be no storm drain infrastructure that will be transferred to public agencies.

Section III Site Description

III.1 Physical Setting

Fill out table with relevant information. *Refer to Section 2.3.1 in the Technical Guidance Document (TGD).*

Name of Planned Community/Planning Area (if applicable)	Precise Development (PD)
Location/Address	1065 Brea Mall
	Brea, California
General Plan Land Use Designation	Regional Commercial
Zoning	Major Shopping Center (CC)
Acreage of Project Site	17.04
Predominant Soil Type	Per Geotechnical Report (see Attachment 2) there were six boring drilled at the site and the subsurface soils consisted of a range of sands, silts, and clays along with combinations of each. Hydrologic Soil Group C/D

III.2 Site Characteristics

Fill out table with relevant information and include information regarding BMP sizing, suitability, and feasibility, as applicable. *Refer to Section 2.3.2 in the Technical Guidance Document (TGD).*

Site Characteristics	
Precipitation Zone	0.90 inches
Topography	As the existing site is developed the general topography is relatively flat with the exception of the sloped berm that separates the lower level parking area from the upper level parking areas. This berm is removed in the proposed condition. In the existing and proposed condition the westerly lower level (DMA #1) primarily slopes from Northeast to Southwest at gentle slopes between 1% and 5%. In the proposed condition the easterly upper level (DMA #2) primarily slopes from North to South at gentle slopes between 2%-5%.
Drainage Patterns/Connections	In both the existing and proposed conditions there is essentially a lower level (westerly) and an upper level (easterly) that provide access to the different mall levels. The primary drainage pattern for the lower level is from Northeast to Southwest and the primary drainage patterns for the upper level is North to South as discussed above. In the existing condition the lower level (west) sheet flows to existing storm drain inlets and discharges to the public storm drain within Randolph Avenue. The proposed project maintains the existing drainage patterns in that the runoff is captured via storm drain inlets, conveyed to the proposed ADS Chamber System for infiltration, and overflows to the public storm drain within Randolph Avenue. This Lower Level is considered DMA #1 for the purposes of this report. In the existing condition the upper level (east) sheet flows to existing storm drain inlets and discharges to the private storm drain adjacent

	to State College Boulevard within the inner ring road of the Mall. The runoff is then conveyed south of the existing Cheesecake Factory and conveyed west to the public storm drain with Randolph Avenue. The proposed project maintains the existing drainage patterns in that the runoff is captured via storm drain inlets, conveyed to the proposed ADS Chamber System for infiltration, and overflows to the same inlet as the existing project site.
Soil Type, Geology, and Infiltration Properties	Per the Geotechnical Report (Attachment 2) there are varying soil types throughout the project site. There were two infiltration tests performed at 10 feet below the ground surface. The first test (P1), near the westerly side of the proposed residential building, did not result in a measurable infiltration rate as the subsurface soils consisted of primarily sandy clay and silty clay. There is no proposed infiltration BMP within this soil group. The second test (P2), north of the proposed Fitness Center had a measured infiltration rate of 2.8 in/hr. The subsurface soils in this located consist primarily of poorly graded sand and sandy silt. Per the factor categories discussed in the Geotechnical Report, and Worksheet H included in Attachment 4, a Factor of Safety equal to 2.5 was applied for a design infiltration rate of 1.12 in/hr in this area. Chamber #1 is located within this soil group. Per the Boring Log (B6) in the Geotechnical Report the subsurface material near Chamber #2 consist of primarily san from a depth of 8.5ft to 13feet under the proposed Chamber System.
Hydrogeologic (Groundwater) Conditions	Per the Geotechnical Report Groundwater was encountered at a depth of 25-30ft below ground surface. As such, there will not be any infiltration restrictions because of groundwater. See also Worksheet I in Attachment 4.
Geotechnical Conditions (relevant to infiltration)	The proposed Chamber Systems were both placed within areas that infiltration rates are expected to be favorable. There is nothing within the Geotechnical Report (outside of measured infiltration rate at P1 – not near a proposed BMP) that recommends or states that infiltration should not be accommodated on the project site. See Attachment 4 “Infiltration BMP Feasibility Worksheet” for reference.
Off-Site Drainage	There is an existing parking lot to the north of DMA #2, which currently drains into DMA #2. The flows will follow existing drainage patterns and drain to the proposed basin at the south side of the site.

	As discussed previously the storm drain overflow pipe from DMA #1 will connect to the existing public storm drain system within Randolph Avenue near the westerly driveway. The storm drain overflow pipe from DMA #2 will connect to the existing private storm drain inlet near the Chamber System, where the overflow runoff will be conveyed to the existing private storm drain pipe within the ring road adjacent to State College Boulevard. The storm drain pipe continues south of the existing Cheesecake Factory and westerly towards the public storm drain connection within Randolph Avenue.
Utility and Infrastructure Information	The project also consists of new utilities within the ring road and paseo areas: • New Domestic Water Service for each building • New Irrigation Service for the lower level (utilize existing service for the upper level) • New Fire Loop, hydrants, and standpipe system within proposed Paseo area • New Sanitary Sewer Service to each building • New Dry Utilities (Electric, Gas) for each building

III.3 Watershed Description

Fill out table with relevant information and include information regarding BMP sizing, suitability, and feasibility, as applicable. *Refer to Section 2.3.3 in the Technical Guidance Document (TGD).*

Receiving Waters	Coyote Creek San Gabriel River Reach 1 San Gabriel River Estuary San Pedro Bay
303(d) Listed Impairments	Coyote Creek: Ammonia, Dissolved Copper, Diazinon, Indicator Bacteria, Lead, pH, Toxicity San Gabriel River Reach 1: Coliform Bacteria, pH San Gabriel River Estuary: Copper, Dioxin, Nickel, Dissolved Oxygen
Applicable TMDLs	Coyote Creek: Metals (Copper, Lead, Zinc) San Gabriel: Metals (Copper, Lead, Zinc), Selenium
Pollutants of Concern for the Project	Metals, Toxic Organic Compounds, Indicator Bacteria (Pathogens)
Environmentally Sensitive and Special Biological Significant Areas	Not Applicable, project is not located within an Environmentally Sensitive Area or Special Biological Significant Area. Also, runoff from the project discharges directly to an existing public storm drain line.

Section IV Best Management Practices (BMPs)

IV. 1 Project Performance Criteria

Describe project performance criteria. Several steps must be followed in order to determine what performance criteria will apply to a project. These steps include:

- If the project has an approved WIHMP or equivalent, then any watershed specific criteria must be used and the project can evaluate participation in the approved regional or sub-regional opportunities. (Please ask your assigned planner or plan checker regarding whether your project is part of an approved WIHMP or equivalent.)
- Determine applicable hydromodification control performance criteria. *Refer to Section 7.II-2.4.2.2 of the Model WQMP.*
- Determine applicable LID performance criteria. *Refer to Section 7.II-2.4.3 of the Model WQMP.*
- Determine applicable treatment control BMP performance criteria. *Refer to Section 7.II-3.2.2 of the Model WQMP.*
- Calculate the LID design storm capture volume for the project. *Refer to Section 7.II-2.4.3 of the Model WQMP.*

(NOC Permit Area only) Is there an approved WIHMP or equivalent for the project area that includes more stringent LID feasibility criteria or if there are opportunities identified for implementing LID on regional or sub-regional basis?		YES ☐	NO ☒
If yes, describe WIHMP feasibility criteria or regional/sub-regional LID opportunities.	Not Applicable - A WIHMP has been developed for the Coyote Creek-San Gabriel River Watershed and has been submitted to the Executive Officer for approval, but has not yet been approved.		

Project Performance Criteria	
If HCOC exists, list applicable hydromodification control performance criteria (Section 7.II-2.4.2.2 in MWQMP)	For proposed projects within the North County permit area that may have an HCOC, each Priority Project proponent must determine the impact of the proposed development on the downstream hydrologic characteristics. The evaluation of potential impacts is based on the following for a two-year frequency storm event: • Increases in runoff volume; • Decreases in infiltration; • Changes in time of concentration; • Potential for increases in post development downstream erosion; and, • Potential for adverse downstream impacts on physical structure, aquatic and riparian habitat. A project does not have an HCOC if either of the following conditions is met: • The volumes and time of concentration of stormwater runoff for the post-development condition do not significantly exceed those of the predevelopment condition for a two-year frequency storm event (a difference of five percent or less is considered insignificant). • The site infiltrates at least the runoff from a two-year storm event. If a hydrologic condition of concern (HCOC) exists, priority projects shall implement onsite or regional hydromodification controls such that: • Post-development runoff volume for the two-year frequency storm does not exceed that of the predevelopment condition by more than five percent, and • Time of concentration of post-development runoff for the two-year storm event is not less than that for the predevelopment condition by more than five percent.
List applicable LID performance criteria (Section 7.II-2.4.3 from MWQMP)	The following performance criteria for LID implementation are stated in both permits: • Priority Projects must infiltrate, harvest and use, evapotranspire, or biotreat/biofilter, the 85th percentile, 24-hour storm event (Design Capture Volume).

List applicable treatment control BMP performance criteria (Section 7.II-3.2.2 from MWQMP)	Not Applicable. Project proposes to infiltrate the full DCV and thus satisfies this treatment control performance criteria
Calculate LID design storm capture volume for Project.	$DCV = C * d * A * 43,560 \text{sf/ac} * 1/12 \text{in/ft}$ (Equation III.1) Where: DCV = runoff volume during the design storm event, cu-ft C = runoff coefficient = $(0.75 * \text{imp} + 0.15)$ imp = impervious fraction of drainage area (ranges from 0 to 1) d = storm depth (inches) A = tributary area (acres) Note that at the time of preparation of this Preliminary WQMP the proposed landscape areas have not been determined. As such, it is conservatively assumed that the entirety of the proposed improvements are 100% impervious (C=0.9). <u>Total Disturbed Area</u> $DCV = (0.9) * (0.9 \text{in}) * (17.04 \text{ac}) * (43,560 \text{sf/ac}) * (1/12 \text{in/ft}) = 50,103 \text{ cf}$ <u>DMA #1 Tributary Area</u> $DCV = (0.9) * (0.9 \text{in}) * (13.72 \text{ac}) * (43,560 \text{sf/ac}) * (1/12 \text{in/ft}) = 40,335 \text{ cf}$ Chamber Volume = 40,445 cf <u>Total Disturbed Area</u> $DCV = (0.9) * (0.9 \text{in}) * (4.09 \text{ac}) * (43,560 \text{sf/ac}) * (1/12 \text{in/ft}) = 12,014 \text{ cf}$ Chamber Volume = 12,056 cf

IV.2. Site Design and Drainage

Describe site design and drainage including

- A narrative of site design practices utilized or rationale for not using practices;
- A narrative of how site is designed to allow BMPs to be incorporated to the MEP
- A table of DMA characteristics and list of LID BMPs proposed in each DMA.
See subsequent Project Specific WQMP Summary Report in the following pages.
- Reference to the WQMP “BMP Exhibit.”
- Calculation of Design Capture Volume (DCV) for each drainage area.
- A listing of GIS coordinates for LID and Treatment Control BMPs.

Refer to Section 2.4.2 in the Technical Guidance Document (TGD).

City of Brea

Project Specific WQMP Summary Report

INSTRUCTIONS: Project applicant, please fill out and check all that apply.

Project Name: Brea Mall Expansion	Project Address: 1066 Brea Mall, Brea, CA 92821

BMP Maintenance Self-Certification Form for the City of Brea

In addition to routine annual inspections conducted by the City for proper maintenance of post-construction stormwater control measures or Best Management Practices (BMPs) on the property, the City of Brea requires that the party responsible for maintenance of these BMPs receive proper orientation and training on their operations and maintenance. This form is to be completed by the owner representative and shall be made available to the City Authorized Inspector upon request. Should the maintenance provider or facility maintenance representative change at any time, the owner representative shall complete this form with the new responsible party for BMP maintenance.

Property Information	BMP O&M
Project Name: Brea Mall Expansion	Responsible Party: (Owner, management company or HOA/POA) Owner
Legal Owner of Record: Simon Property Group	Contact Name: Clif Poynter
Address: 225 West Washington Street Indianapolis, IN 46204	Address:
Telephone: (317) 263-7312	Telephone:
Email: Clif.Poynter@Simon.Com	Email:

As the party responsible for operation and maintenance of the BMPs specified in the approved Water Quality Management Plan (WQMP) for the subject property, I hereby certify under penalty of law that I, or persons under my supervision, are qualified and competent to carry out the inspection and maintenance the BMPs in a manner consistent with the approved WQMP Operation and Maintenance (O&M) Plan.

Maintenance Representative Signature

Date

As the owner representative of the Brea Mall Expansion of which a Water Quality Management Plan (WQMP) was approved by the City, I hereby certify under penalty of law that all BMPs contained within the approved Project WQMP have been maintained and inspected in accordance with the schedule and frequency outlined in the approved WQMP Operation and Maintenance (O&M) Plan. The maintenance activities and inspections conducted have been performed by qualified and knowledgeable individuals listed above. To the best of my knowledge, the information submitted is

true and accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and citations for violating water quality regulations.

Owner/Representative Signature

Date

DMA #1

DMA #1 is 597,559sf and consists of the “lower level” areas including the new A.C. Parking Lot, A.C. Ring Road, and Paseo Areas. The DMA also includes the footprints of the Residential, Fitness, Retail/Restaurant and Sporting Goods Buildings/Roofs. As discussed previously the landscape areas have not yet been determined. As such the impervious area is conservatively taken as 100%.

$$DCV = (0.9) * (0.9\text{in}) * (13.72\text{ac}) * (43,560\text{sf/ac}) * (1/12\text{in/ft}) = 40,335 \text{ cf}$$

The proposed DMA has multiple inlets within the Paseo and along the ring road to capture the storm drain runoff. These inlets are designed with inlet filters for pretreatment (see WQ-03) and are connected via a proposed storm drain pipe. The proposed roof drains will hard-tie directly into the proposed storm drain pipe. From there runoff will be conveyed to the proposed ADS Chamber System #1 as shown in the WQMP Site Plan Sheet WQ-01. The ADS Chamber System is located at 33°54'47"N; 117°53'18"W.

The Chamber System is sized for an area of 9,441sf and will accommodate a volume of 40,445cf, which is greater than the required volume of 40,335 cf for this DMA. Using the design infiltration rate of 1.12in/hr (FS=2.5) the drawdown was calculated to be:

$$(40,335\text{cf}) / [(1.12\text{in/hr}) * (1/12\text{ft/in}) * (9,441\text{sf infiltration footprint})] = \text{Drawdown} = \underline{45.78 \text{ hrs} < 48 \text{ hours}}$$

The chamber system is designed for full infiltration of the DCV. However, in a storm event greater than the design storm there is an overflow provided to the public main within Randolph Avenue. See Sheets WQ-01, WQ-02 and WQ-03 for more information.

DMA #2

DMA #2 is 177,984sf and consists of the “upper level” parking lot and sidewalk areas. This DMA contains a portion of the existing parking lot (97,336sf) that will be treated in lieu of treating a portion of the disturbed parking area (57,680sf). As such this DMA contains 39,656sf more area than is disturbed, which accounts for approximately 2,246cf larger DCV than required. As discussed previously the landscape areas have not yet been determined, as such the impervious area is conservatively taken as 100%.

$$DCV = (0.9) * (0.9\text{in}) * (34.09\text{ac}) * (43,560\text{sf/ac}) * (1/12\text{in/ft}) = 12,014 \text{ cf}$$

The new/existing parking lot areas drain southerly to the proposed valley gutter across the egress driveway and to the storm drain inlet along the south side of the new parking lot. This inlet is designed with an inlet filter for pretreatment (see WQ-05) and discharges to the proposed chamber system with a new storm drain pipe. ADS Chamber System #2 is shown in the WQMP Site Plan Sheet WQ-01. The Sporting Goods loading dock contains a new trench drain with inlet filter, that is routed to the proposed Underground Chamber System as well. The Chamber is located at 33°54'49"N; 117°53'11"W.

The Chamber System #2 is sized for an area of 2,805sf and will accommodate a volume of 12,056cf, which is greater than the required volume of 12,014cf for this DMA. Using the design infiltration rate of 1.12 in/hr (FS=2.5) the drawdown was calculated to be:

$$(12,014\text{cf}) / [(1.12\text{in/hr}) * (1/12\text{ft/in}) * (2,805\text{sf infiltration footprint})] = \text{Drawdown} = \underline{45.89\text{hrs} < 48 \text{ hours}}$$

The Chamber System is designed for full infiltration of the DCV. However, in a storm event greater than the design storm there is an overflow provided to the existing inlet that discharges to the private storm drain within the ring road. See Sheets WQ-01, WQ-04, and WQ-05 for more information.

IV.3 LID BMP Selection and Project Conformance Analysis

Each sub-section below documents that the proposed design features conform to the applicable project performance criteria via check boxes, tables, calculations, narratives, and/or references to worksheets. Refer to Section 2.4.2.3 in the Technical Guidance Document (TGD) for selecting LID BMPs and Section 2.4.3 in the Technical Guidance Document (TGD) for conducting conformance analysis with project performance criteria.

IV.3.1 Hydrologic Source Controls (HSCs)

If required HSCs are included, fill out applicable check box forms. If the retention criteria are otherwise met with other LID BMPs, include a statement indicating HSCs not required.

HSCs not required. Retention Criteria are met with the proposed ADS Chamber Systems.

Name	Included?
Localized on-lot infiltration	☐
Impervious area dispersion (e.g. roof top disconnection)	☐
Street trees (canopy interception)	☐
Residential rain barrels (not actively managed)	☐
Green roofs/Brown roofs	☐
Blue roofs	☐
Impervious area reduction (e.g. permeable pavers, site design)	☐
Other:	☐
Other:	☐
Other:	☐
Other:	☐
Other:	☐
Other:	☐
Other:	☐
Other:	☐

IV.3.2 Infiltration BMPs

Identify infiltration BMPs to be used in project. If design volume cannot be met, state why.

Name	Included?
Bioretention without underdrains	☐
Rain gardens	☐
Porous landscaping	☐
Infiltration planters	☐
Retention swales	☐
Infiltration trenches	☐
Infiltration basins	☐
Drywells	☐
INF-7 Subsurface infiltration galleries	☒
French drains	☐
Permeable asphalt	☐
Permeable concrete	☐
Permeable concrete pavers	☐
Other:	☐
Other:	☐

Show calculations below to demonstrate if the LID Design Storm Capture Volume can be met with infiltration BMPs. If not, document how much can be met with infiltration and document why it is not feasible to meet the full volume with infiltration BMPs.

Chamber #1 (DMA #1)

DCV = 40,335 cf

Volume Provided = 40,445 cf (See Sheet WQ-02/WQ-03 for Details)

Drawdown Time = $(40,335 \text{ cf}) / [(1.12 \text{ in/hr}) * (1/12 \text{ ft/in}) * (9,441 \text{ sf infiltration footprint})] = 45.78 \text{ hrs} < 48 \text{ hours}$

Chamber #2 (DMA #2)

DCV = 12,014 cf

Volume Provided = 12,056 cf (See Sheet WQ-04/WQ-05 for Details)

Drawdown Time = $(12,014 \text{ cf}) / [(1.12 \text{ in/hr}) * (1/12 \text{ ft/in}) * (2,805 \text{ sf infiltration footprint})] = 45.89 \text{ hrs} < 48 \text{ hours}$

IV.3.3 Evapotranspiration, Rainwater Harvesting BMPs

If the full Design Storm Capture Volume cannot be met with infiltration BMPs, describe any evapotranspiration and/or rainwater harvesting BMPs included.

Not Applicable - Full DCV infiltrated

Name	Included?
All HSCs; See Section IV.3.1	☐
Surface-based infiltration BMPs	☐
Biotreatment BMPs	☐
Above-ground cisterns and basins	☐
Underground detention	☐
Other:	☐
Other:	☐
Other:	☐

Show calculations below to demonstrate if the LID Design Storm Capture Volume can be met with evapotranspiration and/or rainwater harvesting BMPs in combination with infiltration BMPs. If not, document below how much can be met with either infiltration BMPs, evapotranspiration, rainwater harvesting BMPs, or a combination, and document why it is not feasible to meet the full volume with these BMP categories.

Not Applicable - Full DCV infiltrated

IV.3.4 Biotreatment BMPs

If the full Design Storm Capture Volume cannot be met with infiltration BMPs, and/or evapotranspiration and rainwater harvesting BMPs, describe biotreatment BMPs included. Include sections for selection, suitability, sizing, and infeasibility, as applicable.

Name	Included?
Bioretention with underdrains	☐
Stormwater planter boxes with underdrains	☐
Rain gardens with underdrains	☐
Constructed wetlands	☐
Vegetated swales	☐
Vegetated filter strips	☐
Proprietary vegetated biotreatment systems	☐
Wet extended detention basin	☐
Dry extended detention basins	☐
Other:	☐
Other:	☐

Show calculations below to demonstrate if the LID Design Storm Capture Volume can be met with infiltration, evapotranspiration, rainwater harvesting and/or biotreatment BMPs. If not, document how much can be met with either infiltration BMPs, evapotranspiration, rainwater harvesting BMPs, or a combination, and document why it is not feasible to meet the full volume with these BMP categories.

Not Applicable - Full DCV infiltrated

IV.3.5 Hydromodification Control BMPs

Describe hydromodification control BMPs. *See Section 5 of the Technical Guidance Document (TGD).* Include sections for selection, suitability, sizing, and infeasibility, as applicable. Detail compliance with Prior Conditions of Approval (if applicable). *The ADS Chamber Systems' function is twofold. They will provide treatment and infiltration of the full DCV, while also providing storage and retention to mitigate peak flows, increase time of concentration, and decrease runoff volume. See Attachment 1 for reference.*

Hydromodification Control BMPs	
BMP Name	BMP Description

IV.3.6 Regional/Sub-Regional LID BMPs

Describe regional/sub-regional LID BMPs in which the project will participate. *Refer to Section 7.II-2.4.3.2 of the Model WQMP.*

Regional/Sub-Regional LID BMPs
Not Applicable

IV.3.7 Treatment Control BMPs

Treatment control BMPs can only be considered if the project conformance analysis indicates that it is not feasible to retain the full design capture volume with LID BMPs. Describe treatment control BMPs including sections for selection, sizing, and infeasibility, as applicable.

Treatment Control BMPs	
BMP Name	BMP Description

IV.3.8 Non-structural Source Control BMPs

Fill out non-structural source control check box forms or provide a brief narrative explaining if non-structural source controls were not used.

Non-Structural Source Control BMPs				
Identifier	Name	Check One		If not applicable, state brief reason
		Included	Not Applicable	
N1	Education for Property Owners, Tenants and Occupants	☒	☐	
N2	Activity Restrictions	☒	☐	
N3	Common Area Landscape Management	☒	☐	
N4	BMP Maintenance	☒	☐	
N5	Title 22 CCR Compliance (How development will comply)	☐	☒	No Hazardous Materials Stored on-site.
N6	Local Industrial Permit Compliance	☐	☒	Not an Industrial Project
N7	Spill Contingency Plan	☐	☒	No Hazardous Materials Stored on-site.
N8	Underground Storage Tank Compliance	☐	☒	No Underground Storage Tanks proposed (i.e. no harvest and use)
N9	Hazardous Materials Disclosure Compliance	☐	☒	No Hazardous Materials Stored on-site.
N10	Uniform Fire Code Implementation	☒	☐	
N11	Common Area Litter Control	☒	☐

IV.4 Alternative Compliance Plan (If Applicable)

Describe an alternative compliance plan (if applicable). Include alternative compliance obligations (i.e., gallons, pounds) and describe proposed alternative compliance measures. *Refer to Section 7.II 3.0 in the WQMP.*

This Section is Not Applicable to the Project.

IV.4.1 Water Quality Credits

Determine if water quality credits are applicable for the project. *Refer to Section 3.1 of the Model WQMP for description of credits and Appendix VI of the Technical Guidance Document (TGD) for calculation methods for applying water quality credits.*

Description of Proposed Project				
Project Types that Qualify for Water Quality Credits (Select all that apply):				
☐ Redevelopment projects that reduce the overall impervious footprint of the project site.	☐ Brownfield redevelopment, meaning redevelopment, expansion, or reuse of real property which may be complicated by the presence or potential presence of hazardous substances, pollutants or contaminants, and which have the potential to contribute to adverse ground or surface WQ if not redeveloped.	☐ Higher density development projects which include two distinct categories (credits can only be taken for one category): those with more than seven units per acre of development (lower credit allowance); vertical density developments, for example, those with a Floor to Area Ratio (FAR) of 2 or those having more than 18 units per acre (greater credit allowance).		
☐ Mixed use development, such as a combination of residential, commercial, industrial, office, institutional, or other land uses which incorporate design principles that can demonstrate environmental benefits that would not be realized through single use projects (e.g. reduced vehicle trip traffic with the potential to reduce sources of water or air pollution).	☐ Transit-oriented developments, such as a mixed use residential or commercial area designed to maximize access to public transportation; similar to above criterion, but where the development center is within one half mile of a mass transit center (e.g. bus, rail, light rail or commuter train station). Such projects would not be able to take credit for both categories, but may have greater credit assigned		☐ Redevelopment projects in an established historic district, historic preservation area, or similar significant city area including core City Center areas (to be defined through mapping).	
☐ Developments with dedication of undeveloped portions to parks, preservation areas and other pervious uses.	☐ Developments in a city center area.	☐ Developments in historic districts or historic preservation areas.	☐ Live-work developments, a variety of developments designed to support residential and vocational needs together – similar to criteria to mixed use development; would not be able to take credit for both categories.	☐ In-fill projects, the conversion of empty lots and other underused spaces into more beneficially used spaces, such as residential or commercial areas.

Calculation of Water Quality Credits (if applicable)	This project has not taken into account any Water Quality Credits.
---	--

IV.4.2 Alternative Compliance Plan Information

Describe an alternative compliance plan (if applicable). Include alternative compliance obligations (i.e., gallons, pounds) and describe proposed alternative compliance measures. *Refer to Section 7.II 3.0 in the Model WQMP.*

Not Applicable

Section V Inspection / Maintenance Responsibility for BMPs

Fill out information in table below. Prepare and attach an Operation and Maintenance Plan. Identify the funding mechanism through which BMPs will be maintained. Inspection and maintenance records must be kept for a minimum of five years for inspection by the regulatory agencies. *Refer to Section 7.II 4.0 in the Model WQMP.*

See subsequent Operation and Maintenance Plan.

OPERATIONS AND MAINTENANCE (O&M) PLAN

PRELIMINARY WATER QUALITY MANAGEMENT PLAN

FOR

1065 BREA MALL

BREA, CA 92821

APN NUMBER: 319-101-37

LEGAL DESCRIPTION:

THE LAND REFERRED TO HEREIN BELOW IS SITUATED IN THE CITY OF BREA, IN THE COUNTY OF ORANGE, STATE OF CALIFORNIA, AND IS DESCRIBED AS FOLLOWS:

ALL THAT CERTAIN REAL PROPERTY SITUATED IN THE COUNTY OF ORANGE, STATE OF CALIFORNIA, DESCRIBED AS FOLLOWS:

PARCEL A:

PARCEL 3, IN THE CITY OF BREA, COUNTY OF ORANGE, STATE OF CALIFORNIA, AS SHOWN ON A MAP FILED IN BOOK 139, PAGES 12 THROUGH 16, INCLUSIVE OF PARCEL MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF ORANGE COUNTY, CALIFORNIA. EXCEPTING THEREFROM ALL OIL, GAS AND OTHER HYDROCARBON SUBSTANCES, MINERALS AND WATER UNDERLYING AT PLANE PARALLEL TO AND 500 FEET, MEASURED VERTICALLY DOWNWARD BELOW THE SURFACE OF SAID LAND, WHICH PORTION IS HEREINAFTER REFERRED TO AS "SUBSURFACE LAND", TOGETHER WITH RIGHTS OF WAY, EASEMENTS AND SERVITUDES IN AND THROUGH SUBSURFACE LAND FOR THE PURPOSE OF EXERCISING THE RIGHTS RESERVED, WHICH INCLUDE BUT ARE NOT LIMITED TO THE RIGHT TO PROSPECT, EXPLORE, MINE, DRILL, PRODUCE, TAKE, TREAT, STORE AND REMOVE ALL SUCH OIL, GAS AND OTHER HYDROCARBON SUBSTANCES, MINERALS AND WATER AND THE RIGHT TO INJECT IN AND REMOVE FROM SUBSURFACE LAND OIL, GAS, WATER OR OTHER FLUIDS FOR THE PURPOSES OF STORAGE, PRESSURE MAINTENANCE, AND/OR SECONDARY RECOVERY OF SUCH OIL, GAS AND OTHER HYDROCARBON SUBSTANCES AND OTHERWISE TO DRILL, COMPLETE AND MAINTAIN WELLS INTO AND THROUGH SUBSURFACE LANDS FROM SURFACE LOCATIONS OUTSIDE THE BOUNDARIES OF HEREIN DESCRIBED LANDS PROVIDED, HOWEVER, THAT THE RIGHTS RESERVED AND RETAINED DO NOT INCLUDE THE RIGHT TO ENTER UPON THE SURFACE OR WITHIN 500 FEET, MEASURED VERTICALLY DOWNWARD BELOW THE SURFACE OF SAID LAND, AS RESERVED BY UNION OIL COMPANY OF CALIFORNIA, A CALIFORNIA CORPORATION, IN DEED RECORDED JUNE 15, 1973 IN BOOK 10751, PAGE 299 OF OFFICIAL RECORDS.

PARCEL B:

NON-EXCLUSIVE EASEMENTS AS GRANTED AND LIMITED BY ARTICLE IV OF THE DOCUMENT ENTITLED "OPERATING AGREEMENT" RECORDED SEPTEMBER 1, 1976 IN BOOK 11874, PAGE 973; AS AMENDED BY INSTRUMENTS RECORDED OCTOBER 30, 1979 IN BOOK 13374, PAGE 419; JANUARY 26, 1984 AS INSTRUMENT NO. 84-037606; JANUARY 26, 1984 AS INSTRUMENT NO. 84-037607; JANUARY 26, 1984 AS INSTRUMENT NO. 84-037608; AND SEPTEMBER 15, 1992 AS INSTRUMENT NO. 92-616518, ALL OF OFFICIAL RECORDS OF SAID ORANGE COUNTY, FOR THE USE OF THE COMMON AREA AS THEREIN DEFINED.

APN: 319-101-37

Appendix A, Operations and Maintenance Plan

Page 1 of 15

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Non-Structural Source Control BMPs			
Yes	N1. Education for Property Owners, Tenants and Occupants Simon Property Group shall conduct orientation during the first four weeks of startup and as on-going. An awareness program will be established to inform all the employees of the impacts of dumping oil, antifreeze, paints, solvents or other potentially harmful chemicals into storm drain; the proper use (e.g., application methods, frequencies and precautions) and management of fertilizers, pesticides and herbicides in landscaping maintenance practices; the impacts of littering and improper water disposal.	• Ensure employees responsible for the maintenance of BMPs are familiar with the requirements of the WQMP. • All new employees trained within 1 month of hire. Annual retraining required.	Simon Property Group
Yes	N2. Activity Restrictions Simon Property Group shall conduct daily management of business activities. Simon Property Group will conduct orientation during the first four weeks of startup and as on-going. Each business activity is restricted under the City of Brea guidance, Conditions, Covenants and Restrictions (CC&Rs), and Conditions of Approval. • No vehicle maintenance activities including vehicle washing • Kitchen mats may not be hosed off outside. • Prohibition of discharge of hazardous waste to the storm drain system. • Prohibition of storage and handling of hazardous materials. • No outdoor storage.	<u>Inspection</u> • Check to ensure that all employees/tenants are adhering to activity restrictions and other restrictions outlined in this WQMP. Retrain/ reeducate as necessary. • Ongoing <u>Maintenance</u> • Provide refresher water quality training. • Annually and as necessary when employee(s) observed to be not adhering to activity restrictions and other restrictions outlined in the WQMP.	Simon Property Group

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Yes	N3. Common Area Landscape Management Simon Property Group will ensure that landscape areas shall be maintained on a weekly basis through Grounds and Maintenance personnel and when new personnel are hired. Maintenance shall include: Plant vegetation that reduces water, fertilizer, herbicide, and pesticide use. Waste shall be disposed of by composting or at a permitted landfill and shall not be raked or blown into the street, gutter, or storm drains. Irrigation systems shall be inspected monthly for leaks. Leaks shall be repaired as soon as they are observed. Avoid over-watering of vegetation. If excessive runoff is observed, automatic timers shall be adjusted. Fertilizers, herbicides, and pesticides shall be used as directed on the label. If fertilizer is spilled on a paved surface it should be swept up immediately and placed in its container. Water shall not be used to clean fertilizer spills unless necessary and only after the area has been thoroughly cleaned using dry cleaning methods. Pesticides, herbicides, and fertilizers shall not be applied within 48 hours prior to rain or if wind speeds exceed 5 mph. For additional information, see Help Prevent Ocean Pollution - Proper Maintenance Practices for Your Business included in Section VII of this report. Also refer to the BMP Maintenance Responsibility /Frequency Matrix in Section V for details.	• Landscape maintenance will consist of trimming and replanting of vegetation (See SC-73 in Section VII), repair and maintenance of irrigation systems (See S4), and appropriate use of fertilizers and pesticides. • Landscape maintenance shall be performed on a weekly basis.	Simon Property Group

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Yes	N4. BMP Maintenance Simon Property Group through its site and landscape maintenance contractors will be responsible for inspection and maintenance activities in landscape areas. Debris and other water pollutants will be controlled, contained and disposed of in a proper manner by the maintenance contractors hired by Simon Property Group. The site maintenance manager will maintain and inspect non-structural and structural BMPs on the site at least once a month. Each BMPs shall be inspected per required frequency of BMP suggested in the Maintenance Responsibility / Frequency Matrix included in Section VI.	Inspect the systems for signs of erosion. - Semi-annually, at minimum, or after each major (1/2") rain event. Maintenance - Remove sediment, and restore to design specifications. Add Riprap and slope protection as needed. - Provide training to employees within 1 month.	Simon Property Group
Yes	N10. Uniform Fire Code Implementation Compliance with Article 80 of the Uniform Fire Code enforced by fire protection agency.	See building plans for fire code implementation.	Simon Property Group
Yes	N11. Common Area Litter Control Simon Property Group through site maintenance contractor shall implement litter control procedures and management in the landscape and parking lot areas in order to prevent and reduce pollution of storm water runoff on a weekly basis. Waste containers located outside shall be provided with spill prevention features and emptied on a regular basis, but as a minimum on a weekly basis. SC-11 Spill Prevention, Control & Cleanup	<u>Inspection</u> - Inspect common areas daily for loose trash/litter. <u>Maintenance</u> - Pick up loose trash/litter and place in trash receptacles. - Mop trash enclosure weekly minimum, or more frequently if needed.	Simon Property Group

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Yes	N12. Employee Training Simon Property Group shall conduct an employee training program and shall inform and train employees engaged in maintenance activities regarding the impacts of dumping oil, antifreeze, paints, solvents or other potentially harmful chemicals into storm sewer; the proper use (e.g., application methods, frequencies and precautions) and management of fertilizers, pesticides and herbicides in landscaping maintenance practice; the impacts of littering and improper water disposal. Employee training program shall be conducted on an ongoing basis and during the first month of startup period. This WQMP shall be a reference to be used for the program and an annual review of the provisions of the WQMP shall be done by each employee. If there are any changes of ownership on the site, a new owner shall be responsible once the ownership is transferred.	Water Quality Management Plan serves as the education for property owners, tenants, and occupants. • Provide water quality orientation to new employees, tenants, etc. • Within two weeks of hire.	Simon Property Group

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Yes	N13. Housekeeping of Loading Docks There will not be pollutants entering the storm drain system from any loading areas. Simon Property Group shall maintain good housekeeping practices in the loading dock environment and keep the dock areas clean and free of debris. Loading areas shall be checked periodically to ensure containment of accumulated water and prevention of storm water run-on. See SD-31 in Section VII for more information.	<u>Inspection</u> • Inspect the loading dock area daily for loose trash/litter and sweep biweekly. • Any spills or broken containers shall be cleaned up immediately. <u>Maintenance</u> • Pick up loose trash/litter and place in trash receptacles. • Daily No wash water is to be discharged to the storm drain system.	Simon Property Group

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Yes	N14. Common Area Catch Basin Inspection Simon Property Group shall be responsible for ensuring that the onsite catch basins, and overflow pipes shall be inspected and maintained once per year, at minimum. See SC-74 in Section VII for more information.	<u>Inspection</u> - Inspect the catch basin for obstructions/debris buildup and to ensure that it continues to function properly. - Four times per year, at minimum. <u>Maintenance</u> - Remove obstructions and clean debris and contaminants out of catch basin to ensure it continues to function properly. - As determined necessary during inspection. Cleaning shall take place prior to the onset of the rainy season (generally accepted as October 1st through April 30th).	Simon Property Group
Yes	N15. Street Sweeping Private Streets and Parking Lots Simon Property Group through its site maintenance contractor shall provide vacuum sweeping of parking lots on a weekly basis. In addition, the sweeping program will be intensified prior to the start of the rainy season around October 15 of every year to minimize water pollution during the "first flush" storm. Further BMPs and information are listed below: SC43-Parking/Storage Area Maintenance SC70-Landscape Maintenance	<u>Inspection</u> - Inspect the parking area daily for loose trash/litter and sweep weekly using sweeping contractor. <u>Maintenance</u> - Pick up loose trash/litter and place in trash receptacles. - Daily	Simon Property Group
Structural Source Control BMPs			

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Yes	S1. Provide Storm Drain System Stenciling and Signage It is widely recognized that the use of storm drains and catch basins for illegal disposal of waste materials can introduce a significant quantity of pollutants into receiving waters. Contributing to this problem is the common misconception that storm drains and sanitary sewers are part of the same system and that materials dumped into storm drains will ultimately arrive at a waste water treatment facility. Stenciling catch basins by the owner will inform the public about non-point source pollution, highlighting the direct link between such basins and sensitive Orange County receiving waters and draws public attention to the fate of materials that are dumped into the storm drain system. The stencil will carry the message "NO DUMPING-DRAINS TO OCEAN". Repair of storm drain system stenciling and signage shall be performed regularly and at least three times a year or as many times a necessary during the storm seasons. SD13-Storm Drain Signage SC44-Drainage System Maintenance	<u>Inspection</u> • Inspect the legibility of storm drain signage. • Once per year, at a minimum. <u>Maintenance</u> • Replace storm drain signage as necessary to maintain legibility. • Catch basins/inlets must be restenciled, at minimum, every 5 years.	Simon Property Group

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Yes	S3. Design Trash Enclosures to Reduce Pollutant Introduction Simon Property Group shall provide trash and waste storage areas through its contractors. Simon Property Group through its site maintenance contractor shall maintain daily. Trash dumpster shall be picked up at least once a week. Loose trash shall be picked up daily and shall be placed in containers periodically. The trash storage areas shall be inspected and maintained daily by the maintenance contractor in order to prevent overflowing dumpster and open lids. The trash container area shall contain trash bins with covers and trash area shall be roofed over in order to prevent rain from entering the bin to reduce water pollution. The bins will be provided with self-closing features and will be inspected on a regular basis as needed for the amount of trash generated. The design of the trash container area will include features such that drainage from adjoining roofs and pavements shall be diverted around the trash container areas. All trash container areas will be surrounded by walls and gates to prevent offsite transport of trash. All employees will be instructed to make sure that covers are kept closed and only opened at the time the trash is deposited. Trash and waste storage areas will be constructed to reduce pollution. It will be located outside the building and trash enclosure will be installed. SD32-Trash Storage Areas	See N11.	Simon Property Group

Appendix A, Operations and Maintenance Plan
Page 9 of 15

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Yes	S4. Use Efficient Irrigation Systems and Landscape Design Projects shall design the timing and application methods of irrigation water to minimize the runoff of excess irrigation water into the municipal storm drain system. (Limited exclusion: detached residential homes.) The following methods to reduce excessive irrigation runoff shall be considered, and incorporated on common areas of development and other areas where determined applicable and feasible by the Permittee: 1. Employing rain shutoff devices to prevent irrigation after precipitation. 2. Designing irrigation systems to each landscape area's specific water requirements. 3. Using flow reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines. 4. Implementing landscape plan consistent with County Water Conservation Resolution or city equivalent, which may include provision of water sensors, programmable irrigation times (for short cycles), etc. 5. The timing and application methods of irrigation water shall be designed to minimize the runoff of excess irrigation water into the municipal storm drain system. 6. Employing other comparable, equally effective, methods to reduce irrigation water runoff. 7. Group plants with similar water requirements in order to reduce excess irrigation runoff and promote surface filtration. Choose plants with low irrigation requirements (for example, native or drought tolerant species). Consider other design features, such as: •Use mulches (such as wood chips or shredded wood products) in planter areas without ground cover to minimize sediment in runoff. •Install appropriate plant materials for the location, in accordance with amount of sunlight and climate, and use native plant material where possible and/or as recommended by the landscape architect. •Leave a vegetative barrier along the property boundary and interior watercourses, to act as a pollutant filter, where appropriate and feasible. •Choose plants that minimize or eliminate the use of fertilizer or pesticides to sustain growth. Irrigation practices shall comply with local and statewide ordinances related to irrigation efficiency. See SD-12 in Section VII for more information.	<u>Inspection</u> • Inspect irrigation equipment for leaks and check timers. • Inspect landscaped areas to ensure vegetation is not being over or under watered. • Monthly. <u>Maintenance</u> • Repair leaks and adjust timers and irrigation heads. • As necessary to maintain proper operation of equipment and to avoid over and under watering of vegetation and excessive runoff from vegetated areas.	Simon Property Group

BMP Applicable? Yes/No	BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Yes	S6. Loading Dock Areas See SD-31 in Section VII for more information.	Loading /unloading dock areas shall include the following: 1. Cover loading dock areas, or design drainage to preclude run-on and runoff, unless the material loaded and unloaded at the docks does not have potential to contribute to stormwater pollution, and this use is ensured for the life of the facility. 2. Direct connections to the municipal storm drain system from below grade loading docks (truck wells) or similar structures are prohibited. Stormwater can be discharged through a permitted connection to the storm drain system with a treatment control BMP applicable to the use. 3. Other comparable and equally effective features that prevent unpermitted discharges to the municipal storm drain system. 4. Housekeeping of loading docks shall be consistent with N13. See CASQA Stormwater Handbook Section 3.2.8 for additional information.	Simon Property Group

BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Low Impact Development BMPs		
Hydrologic Source Control BMP # 1 Not applicable		
Hydrologic Source Control BMP # 2 Not applicable		
Miscellaneous BMP # 1 Drop Inlet	Inspect for standing water. If standing water stands within the inlet between storms and does not drain within 48 hours after rainfall, maintenance of inlet is required. Remove any possible trash or blockage from the inlet, or perform storm drain jetting for maintenance. Inspect inlet for trash and debris accumulation in the drop inlet. If trash and debris have accumulated, it must be removed from the drop inlet and disposed of properly.	Simon Property Group
Miscellaneous BMP # 2 Inlet Stenciling	Review condition of stencil yearly, repaint as needed	Simon Property Group

BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
LID BMP # 1 ADS Infiltration Chamber #1 & #2	Step 1 - Inspect Isolator Row for Sediment A. Inspection Ports i. Remove lid from floor box frame ii. Remove cap from Inspection Riser iii. Using a flashlight and a stadia rod, measure depth of sediment and record results on maintenance log. iv. If sediment is at, or above, 3 inch depth, proceed to Step 2. If not, proceed to Step 3. B. All Isolator Rows i. Remove cover from manhole at upstream end of isolator row ii. Using a flashlight, inspect down isolator row through outlet pipe (mirrors on poles or cameras may be used to avoid a confined space entry; follow OSHA regulations for confined space entry if entering manhole) iii. If sediment is at or above the lower row of sidewall holes (approximately 3 inches) proceed to Step 2. If not proceed to Step 3. Step 2 - Clean out Isolator Row using the JetVac Process A. A fixed culvert cleaning nozzle with rear facing nozzle spread of 45 inches or more is preferable B. Apply multiple passes of JerVac until backflush water is clean C. Vacuum manhole sump as required Step 3 – Replace all Caps, lids and covers, record observations and actions Step 4 – Inspect and clean basins and manholes upstream of the ADS System	Simon Property Group (Inspections shall take place every 6 months during the first year of operation. Adjust the inspection interval based on previous observations of sediment accumulation and high water elevations; conduct jetting and vactoring only when inspections show that maintenance is necessary)

Treatment Control BMPs		
Treatment Control BMP # 1 Not applicable		
Pre-Treatment/Gross Solids Removal BMPs		
BMP Name and BMP Implementation, Maintenance and Inspection Procedures	Implementation, Maintenance, and Inspection Frequency and Schedule	Person or Entity with Operation & Maintenance Responsibility
Pre-Treatment BMP # 1 Bio Clean Grate Inlet Skimmer Box	Inspections should occur following any rain event greater than ½" or at four times per year minimum. 1. Empty the sediment bag if more than half filled with sediment and debris, or as directed. 2. Remove the grate and lift from drainage structure. 3. Dispose of sediment or debris as directed by the Engineer or Maintenance contract. 4. An industrial vacuum can be used to collect sediment. 5. Remove caked on silt from sediment bag and flush with Medium spray with optimal filtration. 6. Replace bag if torn or punctured to >½" diameter on lower half of bag.	Simon Property Group

Pre-Treatment BMP #2 FloGard Trench Drain Insert Filter	Inspections should occur following any rain event greater than ½" of at four times per year minimum. 1. The trench drain grate(s) shall be removed and set to one side. 2. The service shall commence with collection and removal of sediment and debris (litter, leaves, papers, cans, etc.). 3. The trench drain shall be visually inspected for defects and possible illegal dumping. If illegal dumping has occurred, the proper authorities and property owner representative shall be notified as soon as practicable. 4. Using an industrial vacuum, the collected materials shall be removed from the filter liner. (Note: DPS uses a truck-mounted vacuum for servicing FloGard LoPro Trench Drain Filters.) 5. When all of the collected materials have been removed, the filter assembly shall be removed from the drainage inlet. The outer filter liner shall be removed from the filter assembly and filter medium pouches shall be removed by unsnapping the tether from the interior ring and sent to one side. The filter liner, PVC body and fittings shall be inspected for continued serviceability. Minor damage or defects found shall be corrected on the spot and a notation made on the Maintenance Record. More extensive deficiencies that affect the efficiency of the filter (torn liner, etc.), if approved by the customer representative, will be corrected and a quote submitted to the representative along with the Maintenance Record. 6. The filter liner and filter medium pouches shall be inspected for defects and continued serviceability and replaced as necessary and the pouch tethers re-attached to the PVC body interior ring. 7. The grate(s) shall be replaced.	Simon Property Group
--	---	-----------------------------

Required Permits

No permits are required.

Forms to Record BMP Implementation, Maintenance, and Inspection

The form that will be used to record implementation, maintenance, and inspection of BMPs is attached.

Recordkeeping

All records must be maintained for at least five (5) years and must be made available for review upon request.

Attachments

Implementation, Maintenance, and Inspection Form

RECORD OF BMP IMPLEMENTATION, MAINTENANCE, AND INSPECTION

Today's Date:

**Name of Person Performing Activity
(Printed):**

Signature:

BMP Name (As Shown in O&M Plan)	Brief Description of Implementation, Maintenance, and Inspection Activity Performed

Section VI BMP Exhibit (Site Plan)

VI.1 BMP Exhibit (Site Plan)

Include a BMP Exhibit (Site Plan), at a size no less than 24" by 36," which includes the following minimum information:

- Insert in the title block (lower right hand corner) of BMP Exhibit: the WQMP Number (assigned by staff) and the grading/building or Planning Application permit numbers
- Project location (address, tract/lot number(s), etc.)
- Site boundary
- Land uses and land covers, as applicable
- Suitability/feasibility constraints
- Structural BMP locations
- Drainage delineations and flow information
- Delineate the area being treated by each structural BMP
- GIS coordinates for LID and Treatment Control BMPs
- Drainage connections
- BMP details
- Preparer name and stamp

Please do not include any areas outside of the project area or any information not related to drainage or water quality. The approved BMP Exhibit (Site Plan) shall be submitted as a plan sheet on all grading and building plan sets submitted for plan check review and approval. The BMP Exhibit shall be at the same size as the rest of the plan sheets in the submittal and shall have an approval stamp and signature prior to plan check submittal.

VI.2 Submittal and Recordation of Water Quality Management Plan

Following approval of the Final Project-Specific WQMP, three copies of the approved WQMP (including BMP Exhibit, Operations and Maintenance (O&M) Plan, and Appendices) shall be submitted. In addition, these documents shall be submitted in a PDF format.

Each approved WQMP (including BMP Exhibit, Operations and Maintenance (O&M) Plan, and Appendices) shall be recorded in the Orange County Clerk-Recorder's Office, prior to close-out of grading and/or building permit. Educational Materials are not required to be included.

PAVING LEGEND:

- LIGHT DUTY A.C. PAVEMENT
- HEAVY DUTY A.C. PAVEMENT (MILL AND OVERLAY AS NEEDED FOR TRENCHING WITHIN EXISTING RING ROAD)
- CONCRETE PAVEMENT
- PASEO AREA (SOFTSCAPE/HARDSCAPE)
- DECORATIVE PAVERS
- LANDSCAPING
- CONCRETE WALKWAY

LEGEND:

- EXISTING STORM DRAIN
- PROPOSED STORM DRAIN (TO CHAMBER SYSTEM)
- PROPOSED STORM DRAIN (RUN-OFF DRAINS OFF-SITE)
- STORM DRAIN DEMOLITION
- LIMITS OF WORK
- DRAINAGE MANAGEMENT AREA (DMA)
- DISTURBED AREA UNTREATED (57,680 SF)
- EXISTING AREA MITIGATED BY BMP TREATMENT WITHIN DMA (97,336 SF)
- INSTALL BIOCLEAN INLET FILTER AT PROPOSED INLET (SEE DETAIL ON SHEET WQ-05)
- INSTALL FLOGARD INSERT FILTER AT PROPOSED TRENCH DRAIN (SEE DETAIL ON SHEET WQ-03 / WQ-05)

NOTE:
1. BMPs are sized assuming 100% IMPERVIOUS IN THE PROPOSED CONDITION (NORTH ORANGE COUNTY TECHNICAL GUIDANCE DOCUMENT)
2. ALL MEASURED INFILTRATION RATES HAVE A FACTOR OF SAFETY OF 2.5 APPLIED PER TGD REQUIREMENTS AND GEOTECHNICAL REPORT
3. GROUNDWATER DEPTH = 25'-30" DEEP PER GEOTECHNICAL REPORT
4. FULL INFILTRATION OF THE DCV IS FEASIBLE
5. DISTURBED AREA = 742,265 SF; TREATED AREA = 775,543 SF
6. ALL STORM DRAIN INLETS TO BE STENCILED "ONLY RAIN DOWN THE STORM DRAIN" OR APPROVED EQUAL.

Brea Mall West California

STORMTECH CHAMBER SPECIFICATIONS

- CHAMBERS SHALL BE STORMTECH MC-4500 OR APPROVED EQUAL.
- CHAMBERS SHALL BE MANUFACTURED FROM VIRGIN, IMPACT-MODIFIED POLYPROPYLENE COPOLYMERS.
- CHAMBER ROWS SHALL PROVIDE CONTINUOUS, UNOBSTRUCTED INTERNAL SPACE WITH NO INTERNAL SUPPORT PANELS THAT WOULD IMPEDE FLOW OR LIMIT ACCESS FOR INSPECTION.
- THE STRUCTURAL DESIGN OF THE CHAMBERS, THE STRUCTURAL BACKFILL, AND THE INSTALLATION REQUIREMENTS SHALL ENSURE THAT THE LOAD FACTORS SPECIFIED IN THE AASHTO LRD'00 BRIDGE DESIGN SPECIFICATIONS, SECTION 12.12, ARE MET FOR: 1) LONG-DURATION DEAD LOADS AND 2) SHORT-DURATION LIVE LOADS, BASED ON THE AASHTO DESIGN TRUCK WITH CONSIDERATION FOR IMPACT AND MULTIPLE VEHICLE PRESENCES.
- CHAMBERS SHALL MEET THE REQUIREMENTS OF ASTM F2418, "STANDARD SPECIFICATION FOR POLYPROPYLENE (PP) CORRUGATED WALL STORMWATER COLLECTION CHAMBERS".
- CHAMBERS SHALL BE DESIGNED AND ALLOWABLE LOADS DETERMINED IN ACCORDANCE WITH ASTM F2787, "STANDARD PRACTICE FOR STRUCTURAL DESIGN OF THERMOPLASTIC CORRUGATED WALL STORMWATER COLLECTION CHAMBERS".
- ONLY CHAMBERS THAT ARE APPROVED BY THE SITE DESIGN ENGINEER WILL BE ALLOWED. THE CHAMBER MANUFACTURER SHALL SUBMIT THE FOLLOWING UPON REQUEST TO THE SITE DESIGN ENGINEER FOR APPROVAL BEFORE DELIVERING CHAMBERS TO THE PROJECT SITE:
 - A STRUCTURAL EVALUATION SEALED BY A REGISTERED PROFESSIONAL ENGINEER THAT DEMONSTRATES THAT THE SAFETY FACTORS ARE GREATER THAN OR EQUAL TO 1.56 FOR DEAD LOAD AND 1.75 FOR LIVE LOAD, THE MINIMUM REQUIRED BY ASTM F2787 AND BY AASHTO FOR THERMOPLASTIC PIPE.
 - A STRUCTURAL EVALUATION SEALED BY A REGISTERED PROFESSIONAL ENGINEER THAT DEMONSTRATES THAT THE LOAD FACTORS SPECIFIED IN THE AASHTO LRD'00 BRIDGE DESIGN SPECIFICATIONS, SECTION 12.12, ARE MET, THE 10 YEAR CREEP MODULUS DATA SPECIFIED IN ASTM F2418 MUST BE USED AS PART OF THE AASHTO STRUCTURAL EVALUATION TO VERIFY LONG-TERM PERFORMANCE.
 - STRUCTURAL CROSS SECTION DETAIL ON WHICH THE STRUCTURAL EVALUATION IS BASED.
- CHAMBERS AND END CAPS SHALL BE PRODUCED AT AN ISO 9001 CERTIFIED MANUFACTURING FACILITY.

IMPORTANT - NOTES FOR THE BIDDING AND INSTALLATION OF MC-4500 CHAMBER SYSTEM

- STORMTECH MC-4500 CHAMBERS SHALL NOT BE INSTALLED UNTIL THE MANUFACTURER'S REPRESENTATIVE HAS COMPLETED A PRE-CONSTRUCTION MEETING WITH THE INSTALLERS.
- STORMTECH MC-4500 CHAMBERS SHALL BE INSTALLED IN ACCORDANCE WITH THE "STORMTECH MC-3500/MC-4500 CONSTRUCTION GUIDE".
- CHAMBERS ARE NOT TO BE BACKFILLED WITH A DOZER OR EXCAVATOR SITUATED OVER THE CHAMBERS.
STORMTECH RECOMMENDS 3 BACKFILL METHODS:
 - STONESHOOTER LOCATED OFF THE CHAMBER BED.
 - BACKFILL AS ROWS ARE BUILT USING AN EXCAVATOR ON THE FOUNDATION STONE OR SUBGRADE.
 - BACKFILL FROM OUTSIDE THE EXCAVATION USING A LONG BOOM HOE OR EXCAVATOR.
- THE FOUNDATION STONE SHALL BE LEVELED AND COMPACTED PRIOR TO PLACING CHAMBERS.
- JOINTS BETWEEN CHAMBERS SHALL BE PROPERLY SEATED PRIOR TO PLACING STONE.
- MAINTAIN MINIMUM - 9" (230 mm) SPACING BETWEEN THE CHAMBER ROWS.
- INLET AND OUTLET MANIFOLDS MUST BE INSERTED A MINIMUM OF 12" (300 mm) INTO CHAMBER END CAPS.
- EMBEDMENT STONE SURROUNDING CHAMBERS MUST BE A CLEAN, CRUSHED, ANGULAR STONE 3/4-2" (20-50 mm) MEETING THE AASHTO M43 DESIGNATION OF #3 OR #4.
- STONE SHALL BE BROUGHT UP EVENLY AROUND CHAMBERS SO AS NOT TO DISTORT THE CHAMBER SHAPE. STONE DEPTHS SHOULD NEVER DIFFER BY MORE THAN 12" (300 mm) BETWEEN ADJACENT CHAMBER ROWS.
- STONE MUST BE PLACED ON THE TOP CENTER OF THE CHAMBER TO ANCHOR THE CHAMBERS IN PLACE AND PRESERVE ROW SPACING.
- ADS RECOMMENDS THE USE OF "FLEXSTORM CATCH IT" INSERTS DURING CONSTRUCTION FOR ALL INLETS TO PROTECT THE SUBSURFACE STORMWATER MANIFOLD SYSTEM FROM CONSTRUCTION SITE RUNOFF.

NOTES FOR CONSTRUCTION EQUIPMENT

- STORMTECH MC-4500 CHAMBERS SHALL BE INSTALLED IN ACCORDANCE WITH THE "STORMTECH MC-3500/MC-4500 CONSTRUCTION GUIDE".
- THE USE OF EQUIPMENT OVER MC-4500 CHAMBERS IS LIMITED:
 - NO EQUIPMENT IS ALLOWED ON BARE CHAMBERS.
 - NO RUBBER Tired LOADER, DUMP TRUCK, OR EXCAVATORS ARE ALLOWED UNTIL PROPER FILL DEPTHS ARE REACHED IN ACCORDANCE WITH THE "STORMTECH MC-3500/MC-4500 CONSTRUCTION GUIDE".
 - WEIGHT LIMITS FOR CONSTRUCTION EQUIPMENT CAN BE FOUND IN THE "STORMTECH MC-3500/MC-4500 CONSTRUCTION GUIDE".
- FULL 36" (900 mm) OF STABILIZED COVER MATERIALS OVER THE CHAMBERS IS REQUIRED FOR DUMP TRUCK TRAVEL OR DUMPING.

USE OF A DOZER TO PUSH EMBEDMENT STONE BETWEEN THE ROWS OF CHAMBERS MAY CAUSE DAMAGE TO CHAMBERS AND IS NOT AN ACCEPTABLE BACKFILL METHOD. ANY CHAMBERS DAMAGED BY USING THE "DUMP AND PUSH" METHOD ARE NOT COVERED UNDER THE STORMTECH STANDARD WARRANTY.

CONTACT STORMTECH AT 1-888-862-2664 WITH ANY QUESTIONS ON INSTALLATION REQUIREMENTS OR WEIGHT LIMITS FOR CONSTRUCTION EQUIPMENT.

CONCEPTUAL LAYOUT
(230) STORMTECH MC-4500 CHAMBERS
(12) STORMTECH MC-4500 END CAPS
INSTALLED WITH 12" COVER STONE, 40% STONE VOID
INSTALLED SYSTEM VOLUME: 46446 CF
AREA OF SYSTEM: 9441 FT²
PERIMETER OF SYSTEM: 458 FT

COMPUTER GENERATED CONCEPTUAL LAYOUT - NOT FOR CONSTRUCTION

ACCEPTABLE FILL MATERIALS: STORMTECH MC-4500 CHAMBER SYSTEMS

MATERIAL LOCATION	DESCRIPTION	AASHTO MATERIAL CLASSIFICATIONS	COMPACTION / DENSITY REQUIREMENT
D	FINAL FILL: FILL MATERIAL FOR LAYER 'D' STARTS FROM THE TOP OF THE 'C' LAYER TO THE BOTTOM OF FLEXIBLE PAVEMENT OR UNPAVED FINISHED GRADE ABOVE. NOTE THAT PAVEMENT SUBBASE MAY BE PART OF THE 'D' LAYER.	N/A	PREPARE PER SITE DESIGN ENGINEER'S PLANS. PAVED INSTALLATIONS MAY HAVE STRINGENT MATERIAL AND PREPARATION REQUIREMENTS.
C	INITIAL FILL: FILL MATERIAL FOR LAYER 'C' STARTS FROM THE TOP OF THE EMBEDMENT STONE (B LAYER) TO 24" (600 mm) ABOVE THE TOP OF THE CHAMBER. NOTE THAT PAVEMENT SUBBASE MAY BE A PART OF THE 'C' LAYER.	AASHTO M145 ¹ A-1, A-2, A-4, A-5 OR AASHTO M43 ¹ 3, 357, 4, 467, 5, 56, 57, 6, 67, 68, 7, 78, 8, 89, 9, 10	BEGIN COMPACTIONS AFTER 24" (600 mm) OF MATERIAL OVER THE CHAMBERS IS REACHED. COMPACT ADDITIONAL LAYERS IN 12" (300 mm) MAX LIFTS TO A MIN. 96% PROCTOR DENSITY FOR WELL GRADED MATERIAL AND 90% RELATIVE DENSITY FOR PROCESSED AGGREGATE MATERIALS.
B	EMBEDMENT STONE: FILL SURROUNDING THE CHAMBERS FROM THE FOUNDATION STONE (A LAYER) TO THE 'C' LAYER ABOVE.	AASHTO M43 ¹ 3, 4	NO COMPACTION REQUIRED.
A	FOUNDATION STONE: FILL BELOW CHAMBERS FROM THE SUBGRADE UP TO THE FOOT (BOTTOM) OF THE CHAMBER.	AASHTO M43 ¹ 3, 4	PLATE COMPACT OR ROLL TO ACHIEVE A FLAT SURFACE. ^{1,2}

PLEASE NOTE:
1. THE LISTED AASHTO DESIGNATIONS ARE FOR GRADATIONS ONLY. THE STONE MUST ALSO BE CLEAN, CRUSHED, ANGULAR. FOR EXAMPLE, A SPECIFICATION FOR #4 STONE WOULD STATE: "CLEAN, CRUSHED, ANGULAR NO. 4 (AASHTO M43) STONE".
2. STORMTECH COMPACTION REQUIREMENTS ARE MET FOR 'A' LOCATION MATERIALS WHEN PLACED AND COMPACTED IN 9" (230 mm) (MAX) LIFTS USING TWO FULL COVERAGES WITH A VIBRATORY COMPACTOR.
3. WHERE INFILTRATION SURFACES MAY BE COMPROMISED BY COMPACTION, FOR STANDARD DESIGN LOAD CONDITIONS, A FLAT SURFACE MAY BE ACHIEVED BY RAKING OR DRAGGING WITHOUT COMPACTION EQUIPMENT. FOR SPECIAL LOAD DESIGNS, CONTACT STORMTECH FOR COMPACTION REQUIREMENTS.

NOTES:

- MC-4500 CHAMBERS SHALL CONFORM TO THE REQUIREMENTS OF ASTM F2418 "STANDARD SPECIFICATION FOR POLYPROPYLENE (PP) CORRUGATED WALL STORMWATER COLLECTION CHAMBERS".
- MC-4500 CHAMBERS SHALL BE DESIGNED IN ACCORDANCE WITH ASTM F2787 "STANDARD PRACTICE FOR STRUCTURAL DESIGN OF THERMOPLASTIC CORRUGATED WALL STORMWATER COLLECTION CHAMBERS".
- "ACCEPTABLE FILL MATERIALS" TABLE ABOVE PROVIDES MATERIAL LOCATIONS, DESCRIPTIONS, GRADATIONS, AND COMPACTION REQUIREMENTS FOR FOUNDATION, EMBEDMENT, AND FILL MATERIALS.
- THE "SITE DESIGN ENGINEER" REFERS TO THE ENGINEER RESPONSIBLE FOR THE DESIGN AND LAYOUT OF THE STORMTECH CHAMBERS FOR THIS PROJECT.
- THE SITE DESIGN ENGINEER IS RESPONSIBLE FOR ASSESSING THE BEARING RESISTANCE (ALLOWABLE BEARING CAPACITY) OF THE SUBGRADE SOILS AND THE DEPTH OF FOUNDATION STONE WITH CONSIDERATION FOR THE RANGE OF EXPECTED SOIL MOISTURE CONDITIONS.
- PERIMETER STONE MUST BE EXTENDED HORIZONTALLY TO THE EXCAVATION WALL FOR BOTH VERTICAL AND SLOPED EXCAVATION WALLS.
- ONCE LAYER 'C' IS PLACED, ANY SOIL/MATERIAL CAN BE PLACED IN LAYER 'D' UP TO THE FINISHED GRADE. MOST PAVEMENT SUBBASE SOILS CAN BE USED TO REPLACE THE MATERIAL REQUIREMENTS OF LAYER 'C' OR 'D' AT THE SITE DESIGN ENGINEER'S DISCRETION.

INSPECTION & MAINTENANCE

- STEP 1) INSPECT ISOLATOR ROW FOR SEDIMENT
- INSPECTION PORTS (IF PRESENT)
 - REMOVE/OPEN LID ON NYLOPLAST INLINE DRAIN
 - REMOVE AND CLEAN FLEXSTORM FILTER IF INSTALLED
 - USING A FLASHLIGHT AND STADIA ROD, MEASURE DEPTH OF SEDIMENT AND RECORD ON MAINTENANCE LOG
 - LOWER A CAMERA INTO ISOLATOR ROW FOR VISUAL INSPECTION OF SEDIMENT LEVELS (OPTIONAL)
 - IF SEDIMENT IS AT, OR ABOVE, 3" (80 mm) PROCEED TO STEP 2. IF NOT, PROCEED TO STEP 3.
- B. ALL ISOLATOR ROWS
- REMOVE COVER FROM STRUCTURE AT UPSTREAM END OF ISOLATOR ROW
 - USING A FLASHLIGHT, INSPECT DOWN THE ISOLATOR ROW THROUGH OUTLET PIPE
 - MIRRORS ON POLES OR CAMERAS MAY BE USED TO AVOID A CONFINED SPACE ENTRY
 - FOLLOW OSHA REGULATIONS FOR CONFINED SPACE ENTRY IF ENTERING MANHOLE
 - IF SEDIMENT IS AT, OR ABOVE, 3" (80 mm) PROCEED TO STEP 2. IF NOT, PROCEED TO STEP 3.
- STEP 2) CLEAN OUT ISOLATOR ROW USING THE JETVAC PROCESS
- A FIXED CULVERT CLEANING NOZZLE WITH REAR FACING SPREAD OF 45° (1.1 m) OR MORE IS PREFERRED
 - APPLY MULTIPLE PASSES OF JETVAC UNTIL BACKFLUSH WATER IS CLEAN
 - VACUUM STRUCTURE SUMP AS REQUIRED
- STEP 3) REPLACE ALL COVERS, GRATES, FILTERS, AND LIDS, RECORD OBSERVATIONS AND ACTIONS.
- STEP 4) INSPECT AND CLEAN BASINS AND MANHOLES UPSTREAM OF THE STORMTECH SYSTEM.

NOTES

- INSPECT EVERY 6 MONTHS DURING THE FIRST YEAR OF OPERATION. ADJUST THE INSPECTION INTERVAL BASED ON PREVIOUS OBSERVATIONS OF SEDIMENT ACCUMULATION AND HIGH WATER ELEVATIONS.
- CONDUCT JETTING AND VACTORING ANNUALLY OR WHEN INSPECTION SHOWS THAT MAINTENANCE IS NECESSARY.

INF-7: Underground Infiltration

Underground infiltration is a vault or chamber with an open bottom that used to store runoff and percolate into the subsurface. A number of vendors offer proprietary infiltration products that allow for similar or enhanced rates of infiltration and subsurface storage while offering durable prefrabricated structures. There are many varieties of proprietary infiltration BMPs that can be used for roads and parking lots, parks and open spaces, single and multi-family residential, or mixed-use and commercial uses.

Also known as:

- *Infiltration vault*
- *Recharge vault*

Underground Infiltration

Source: <http://www.contech-cpi.com>

Feasibility Screening Considerations

- Infiltration bays shall pass infeasible screening criteria to be considered for use.
- Underground infiltration galleries pose a potential risk of groundwater contamination; pretreatment should be used.

Opportunity Criteria

- Soils are adequate for infiltration or can be amended to provide an adequate infiltration rate.
- Appropriate for sites with limited surface space.
- Can be placed beneath roads, parking lots, parks, and athletic fields.
- Potential for groundwater contamination can be mitigated through isolation of pollutant sources, pretreatment of inflow, and/or demonstration of adequate treatment capacity of underlying soils.
- Infiltration is into native soil, or depth of engineered fill is ≤ 5 feet from the bottom of the facility to native material and infiltration into fill is approved by a geotechnical professional.
- Tributary area land uses include mixed-use and commercial, single-family and multi-family, roads and parking lots, and parks and open spaces. High pollutant land uses should not be tributary to infiltration BMPs.

OC-Specific Design Criteria and Considerations

- ☐ Placement of BMPs should observe geotechnical recommendations with respect to geological hazards (e.g. landslides, liquefaction zones, erosion, etc.) and set-backs (e.g., foundations, utilities, roadways, etc.)
- ☐ Minimum separation to mounded seasonally high groundwater of 10 feet shall be observed.
- ☐ Minimum pretreatment should be provided upstream of the infiltration facility, and water bypassing pretreatment should not be directed to the facility.
- ☐ Underground infiltration should not be used for drainage areas with high sediment production potential unless preceded by full treatment control with a BMP effective for sediment removal.
- ☐ Design infiltration rate should be determined as described in [Appendix VII](#).
- ☐ Inspection ports or similar design features shall be provided to verify continued system performance and identify need for major maintenance.

- ☐ For infiltration facilities beneath roads and parking areas, structural requirements should meet H-20 load requirements.

Computing Underground Infiltration Device Size

Underground infiltration devices vary by design and by proprietary designs. The sizing method selected for use must be based on the BMP type it most strongly resembles.

- For underground infiltration devices with open pore volume (e.g., vaults, crates, pipe sections, etc), sizing will be most similar to infiltration basins.
- For underground infiltration devices with pore space (e.g., aggregate reservoirs), sizing will be most similar to permeable pavement.

***Preventing water
pollution at your
commercial/industrial site***

Clean beaches and healthy creeks, rivers, bays and ocean are important to Orange County. However, many landscape and building maintenance activities can lead to water pollution if you're not careful. Paint, chemicals, plant clippings and other materials can be blown or washed into storm drains that flow to the ocean. Unlike water in sanitary sewers (from sinks and toilets), water in storm drains is not treated before entering our waterways.

You would never pour soap or fertilizers into the ocean, so why would you let them enter the storm drains? Follow these easy tips to help prevent water pollution.

Some types of industrial facilities are required to obtain coverage under the State General Industrial Permit. For more information visit: www.swrcb.ca.gov/stormwater/industrial.html

For more information,
please call the
Orange County Stormwater Program
at **1-877-89-SPILL** (1-877-897-7455)
or visit
www.ocwatersheds.com

To report a spill,
call the
**Orange County 24-Hour
Water Pollution Problem
Reporting Hotline**
at **1-877-89-SPILL** (1-877-897-7455).

For emergencies, dial 911.

Help Prevent Ocean Pollution:

Proper Maintenance Practices for Your Business

**The Ocean Begins
at Your Front Door**

Proper Maintenance Practices for your Business

Landscape Maintenance

- Compost grass clippings, leaves, sticks and other vegetation, or dispose of it at a permitted landfill or in green waste containers. Do not dispose of these materials in the street, gutter or storm drain.
- Irrigate slowly and inspect the system for leaks, overspraying and runoff. Adjust automatic timers to avoid overwatering.
- Follow label directions for the use and disposal of fertilizers and pesticides.
- Do not apply pesticides or fertilizers if rain is expected within 48 hours or if wind speeds are above 5 mph.
- Do not spray pesticides within 100 feet of waterways.
- Fertilizers should be worked into the soil rather than dumped onto the surface.
- If fertilizer is spilled on the pavement or sidewalk, sweep it up immediately and place it back in the container.

Building Maintenance

- Never allow washwater, sweepings or sediment to enter the storm drain.
- Sweep up dry spills and use cat litter, towels or similar materials to absorb wet spills. Dispose of it in the trash.
- If you wash your building, sidewalk or parking lot, you **must** contain the water. Use a shop vac to collect the water and contact your city or sanitation agency for proper disposal information. Do not let water enter the street, gutter or storm drain.
- Use drop cloths underneath outdoor painting, scraping, and sandblasting work, and properly dispose of materials in the trash.
- Use a ground cloth or oversized tub for mixing paint and cleaning tools.
- Use a damp mop or broom to clean floors.
- Cover dumpsters to keep insects, animals, rainwater and sand from entering. Keep the area around the dumpster clear of trash and debris. Do not overfill the dumpster.

- Call your trash hauler to replace leaking dumpsters.
- Do not dump any toxic substance or liquid waste on the pavement, the ground, or near a storm drain. Even materials that seem harmless such as latex paint or biodegradable cleaners can damage the environment.
- Recycle paints, solvents and other materials. For more information about recycling and collection centers, visit www.oclandfills.com.
- Store materials indoors or under cover and away from storm drains.
- Use a construction and demolition recycling company to recycle lumber, paper, cardboard, metals, masonry, carpet, plastic, pipes, drywall, rocks, dirt, and green waste. For a listing of construction and demolition recycling locations in your area, visit www.ciwmb.ca.gov/recycle.
- Properly label materials. Familiarize employees with Material Safety Data Sheets.

NEVER DISPOSE
OF ANYTHING
IN THE STORM
DRAIN.

Spill Prevention, Control & Cleanup SC-11

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize
- Product Substitution

Description

Many activities that occur at an industrial or commercial site have the potential to cause accidental or illegal spills. Preparation for accidental or illegal spills, with proper training and reporting systems implemented, can minimize the discharge of pollutants to the environment.

Spills and leaks are one of the largest contributors of stormwater pollutants. Spill prevention and control plans are applicable to any site at which hazardous materials are stored or used. An effective plan should have spill prevention and response procedures that identify potential spill areas, specify material handling procedures, describe spill response procedures, and provide spill clean-up equipment. The plan should take steps to identify and characterize potential spills, eliminate and reduce spill potential, respond to spills when they occur in an effort to prevent pollutants from entering the stormwater drainage system, and train personnel to prevent and control future spills.

Approach

Pollution Prevention

- Develop procedures to prevent/mitigate spills to storm drain systems. Develop and standardize reporting procedures, containment, storage, and disposal activities, documentation, and follow-up procedures.
- Develop a Spill Prevention Control and Countermeasure (SPCC) Plan. The plan should include:

Targeted Constituents

Sediment	
Nutrients	
Trash	
Metals	☒
Bacteria	
Oil and Grease	☒
Organics	☒

SC-11 Spill Prevention, Control & Cleanup

- Description of the facility, owner and address, activities and chemicals present
 - Facility map
 - Notification and evacuation procedures
 - Cleanup instructions
 - Identification of responsible departments
 - Identify key spill response personnel
- Recycle, reclaim, or reuse materials whenever possible. This will reduce the amount of process materials that are brought into the facility.

Suggested Protocols (including equipment needs)

Spill Prevention

- Develop procedures to prevent/mitigate spills to storm drain systems. Develop and standardize reporting procedures, containment, storage, and disposal activities, documentation, and follow-up procedures.
- If consistent illegal dumping is observed at the facility:
 - Post “No Dumping” signs with a phone number for reporting illegal dumping and disposal. Signs should also indicate fines and penalties applicable for illegal dumping.
 - Landscaping and beautification efforts may also discourage illegal dumping.
 - Bright lighting and/or entrance barriers may also be needed to discourage illegal dumping.
- Store and contain liquid materials in such a manner that if the tank is ruptured, the contents will not discharge, flow, or be washed into the storm drainage system, surface waters, or groundwater.
- If the liquid is oil, gas, or other material that separates from and floats on water, install a spill control device (such as a tee section) in the catch basins that collects runoff from the storage tank area.
- Routine maintenance:
 - Place drip pans or absorbent materials beneath all mounted taps, and at all potential drip and spill locations during filling and unloading of tanks. Any collected liquids or soiled absorbent materials must be reused/recycled or properly disposed.
 - Store and maintain appropriate spill cleanup materials in a location known to all near the tank storage area; and ensure that employees are familiar with the site’s spill control plan and/or proper spill cleanup procedures.
 - Sweep and clean the storage area monthly if it is paved, *do not hose down the area to a storm drain.*

Spill Prevention, Control & Cleanup SC-11

- Check tanks (and any containment sumps) daily for leaks and spills. Replace tanks that are leaking, corroded, or otherwise deteriorating with tanks in good condition. Collect all spilled liquids and properly dispose of them.
- Label all containers according to their contents (e.g., solvent, gasoline).
- Label hazardous substances regarding the potential hazard (corrosive, radioactive, flammable, explosive, poisonous).
- Prominently display required labels on transported hazardous and toxic materials (per US DOT regulations).
- Identify key spill response personnel.

Spill Control and Cleanup Activities

- Follow the Spill Prevention Control and Countermeasure Plan.
- Clean up leaks and spills immediately.
- Place a stockpile of spill cleanup materials where it will be readily accessible (e.g., near storage and maintenance areas).
- On paved surfaces, clean up spills with as little water as possible. Use a rag for small spills, a damp mop for general cleanup, and absorbent material for larger spills. If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be sent to a certified laundry (rags) or disposed of as hazardous waste. Physical methods for the cleanup of dry chemicals include the use of brooms, shovels, sweepers, or plows.
- Never hose down or bury dry material spills. Sweep up the material and dispose of properly.
- Chemical cleanups of material can be achieved with the use of adsorbents, gels, and foams. Use adsorbent materials on small spills rather than hosing down the spill. Remove the adsorbent materials promptly and dispose of properly.
- For larger spills, a private spill cleanup company or Hazmat team may be necessary.

Reporting

- Report spills that pose an immediate threat to human health or the environment to the Regional Water Quality Control Board.
- Federal regulations require that any oil spill into a water body or onto an adjoining shoreline be reported to the National Response Center (NRC) at 800-424-8802 (24 hour).
- Report spills to local agencies, such as the fire department; they can assist in cleanup.
- Establish a system for tracking incidents. The system should be designed to identify the following:
 - Types and quantities (in some cases) of wastes
 - Patterns in time of occurrence (time of day/night, month, or year)

SC-11 Spill Prevention, Control & Cleanup

- Mode of dumping (abandoned containers, “midnight dumping” from moving vehicles, direct dumping of materials, accidents/spills)
- Responsible parties

Training

- Educate employees about spill prevention and cleanup.
- Well-trained employees can reduce human errors that lead to accidental releases or spills:
 - The employee should have the tools and knowledge to immediately begin cleaning up a spill should one occur.
 - Employees should be familiar with the Spill Prevention Control and Countermeasure Plan.
- Employees should be educated about aboveground storage tank requirements. Employees responsible for aboveground storage tanks and liquid transfers should be thoroughly familiar with the Spill Prevention Control and Countermeasure Plan and the plan should be readily available.
- Train employees to recognize and report illegal dumping incidents.

Other Considerations (Limitations and Regulations)

- A Spill Prevention Control and Countermeasure Plan (SPCC) is required for facilities that are subject to the oil pollution regulations specified in Part 112 of Title 40 of the Code of Federal Regulations or if they have a storage capacity of 10,000 gallons or more of petroleum. (Health and Safety Code 6.67)
- State regulations also exist for storage of hazardous materials (Health & Safety Code Chapter 6.95), including the preparation of area and business plans for emergency response to the releases or threatened releases.
- Consider requiring smaller secondary containment areas (less than 200 sq. ft.) to be connected to the sanitary sewer, prohibiting any hard connections to the storm drain.

Requirements

Costs (including capital and operation & maintenance)

- Will vary depending on the size of the facility and the necessary controls.
- Prevention of leaks and spills is inexpensive. Treatment and/or disposal of contaminated soil or water can be quite expensive.

Maintenance (including administrative and staffing)

- This BMP has no major administrative or staffing requirements. However, extra time is needed to properly handle and dispose of spills, which results in increased labor costs.

Spill Prevention, Control & Cleanup SC-11

Supplemental Information

Further Detail of the BMP

Reporting

Record keeping and internal reporting represent good operating practices because they can increase the efficiency of the facility and the effectiveness of BMPs. A good record keeping system helps the facility minimize incident recurrence, correctly respond with appropriate cleanup activities, and comply with legal requirements. A record keeping and reporting system should be set up for documenting spills, leaks, and other discharges, including discharges of hazardous substances in reportable quantities. Incident records describe the quality and quantity of non-stormwater discharges to the storm sewer. These records should contain the following information:

- Date and time of the incident
- Weather conditions
- Duration of the spill/leak/discharge
- Cause of the spill/leak/discharge
- Response procedures implemented
- Persons notified
- Environmental problems associated with the spill/leak/discharge

Separate record keeping systems should be established to document housekeeping and preventive maintenance inspections, and training activities. All housekeeping and preventive maintenance inspections should be documented. Inspection documentation should contain the following information:

- The date and time the inspection was performed
- Name of the inspector
- Items inspected
- Problems noted
- Corrective action required
- Date corrective action was taken

Other means to document and record inspection results are field notes, timed and dated photographs, videotapes, and drawings and maps.

Aboveground Tank Leak and Spill Control

Accidental releases of materials from aboveground liquid storage tanks present the potential for contaminating stormwater with many different pollutants. Materials spilled, leaked, or lost from

SC-11 Spill Prevention, Control & Cleanup

tanks may accumulate in soils or on impervious surfaces and be carried away by stormwater runoff.

The most common causes of unintentional releases are:

- Installation problems
- Failure of piping systems (pipes, pumps, flanges, couplings, hoses, and valves)
- External corrosion and structural failure
- Spills and overfills due to operator error
- Leaks during pumping of liquids or gases from truck or rail car to a storage tank or vice versa

Storage of reactive, ignitable, or flammable liquids should comply with the Uniform Fire Code and the National Electric Code. Practices listed below should be employed to enhance the code requirements:

- Tanks should be placed in a designated area.
- Tanks located in areas where firearms are discharged should be encapsulated in concrete or the equivalent.
- Designated areas should be impervious and paved with Portland cement concrete, free of cracks and gaps, in order to contain leaks and spills.
- Liquid materials should be stored in UL approved double walled tanks or surrounded by a curb or dike to provide the volume to contain 10 percent of the volume of all of the containers or 110 percent of the volume of the largest container, whichever is greater. The area inside the curb should slope to a drain.
- For used oil or dangerous waste, a dead-end sump should be installed in the drain.
- All other liquids should be drained to the sanitary sewer if available. The drain must have a positive control such as a lock, valve, or plug to prevent release of contaminated liquids.
- Accumulated stormwater in petroleum storage areas should be passed through an oil/water separator.

Maintenance is critical to preventing leaks and spills. Conduct routine inspections and:

- Check for external corrosion and structural failure.
- Check for spills and overfills due to operator error.
- Check for failure of piping system (pipes, pumps, flanger, coupling, hoses, and valves).
- Check for leaks or spills during pumping of liquids or gases from truck or rail car to a storage facility or vice versa.

Spill Prevention, Control & Cleanup SC-11

- Visually inspect new tank or container installation for loose fittings, poor welding, and improper or poorly fitted gaskets.
- Inspect tank foundations, connections, coatings, and tank walls and piping system. Look for corrosion, leaks, cracks, scratches, and other physical damage that may weaken the tank or container system.
- Frequently relocate accumulated stormwater during the wet season.
- Periodically conduct integrity testing by a qualified professional.

Vehicle Leak and Spill Control

Major spills on roadways and other public areas are generally handled by highly trained Hazmat teams from local fire departments or environmental health departments. The measures listed below pertain to leaks and smaller spills at vehicle maintenance shops.

In addition to implementing the spill prevention, control, and clean up practices above, use the following measures related to specific activities:

Vehicle and Equipment Maintenance

- Perform all vehicle fluid removal or changing inside or under cover to prevent the run-on of stormwater and the runoff of spills.
- Regularly inspect vehicles and equipment for leaks, and repair immediately.
- Check incoming vehicles and equipment (including delivery trucks, and employee and subcontractor vehicles) for leaking oil and fluids. Do not allow leaking vehicles or equipment onsite.
- Always use secondary containment, such as a drain pan or drop cloth, to catch spills or leaks when removing or changing fluids.
- Immediately drain all fluids from wrecked vehicles.
- Store wrecked vehicles or damaged equipment under cover.
- Place drip pans or absorbent materials under heavy equipment when not in use.
- Use adsorbent materials on small spills rather than hosing down the spill.
- Remove the adsorbent materials promptly and dispose of properly.
- Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around.
- Oil filters disposed of in trashcans or dumpsters can leak oil and contaminate stormwater. Place the oil filter in a funnel over a waste oil recycling drum to drain excess oil before disposal. Oil filters can also be recycled. Ask your oil supplier or recycler about recycling oil filters.

SC-11 Spill Prevention, Control & Cleanup

- Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries, even if you think all the acid has drained out. If you drop a battery, treat it as if it is cracked. Put it into the containment area until you are sure it is not leaking.

Vehicle and Equipment Fueling

- Design the fueling area to prevent the run-on of stormwater and the runoff of spills:
 - Cover fueling area if possible.
 - Use a perimeter drain or slope pavement inward with drainage to a sump.
 - Pave fueling area with concrete rather than asphalt.
- If dead-end sump is not used to collect spills, install an oil/water separator.
- Install vapor recovery nozzles to help control drips as well as air pollution.
- Discourage “topping-off” of fuel tanks.
- Use secondary containment when transferring fuel from the tank truck to the fuel tank.
- Use adsorbent materials on small spills and general cleaning rather than hosing down the area. Remove the adsorbent materials promptly.
- Carry out all Federal and State requirements regarding underground storage tanks, or install above ground tanks.
- Do not use mobile fueling of mobile industrial equipment around the facility; rather, transport the equipment to designated fueling areas.
- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- Train employees in proper fueling and cleanup procedures.

Industrial Spill Prevention Response

For the purposes of developing a spill prevention and response program to meet the stormwater regulations, facility managers should use information provided in this fact sheet and the spill prevention/response portions of the fact sheets in this handbook, for specific activities. The program should:

- Integrate with existing emergency response/hazardous materials programs (e.g., Fire Department)
- Develop procedures to prevent/mitigate spills to storm drain systems
- Identify responsible departments
- Develop and standardize reporting procedures, containment, storage, and disposal activities, documentation, and follow-up procedures
- Address spills at municipal facilities, as well as public areas

Spill Prevention, Control & Cleanup SC-11

- Provide training concerning spill prevention, response and cleanup to all appropriate personnel

<http://www.co.clark.wa.us/pubworks/bmpman.pdf>

King County Storm Water Pollution Control Manual <http://dnr.metrokc.gov/wlr/dss/spcm.htm>

Santa Clara Valley Urban Runoff Pollution Prevention Program <http://www.scvurppp.org>

The Stormwater Managers Resource Center <http://www.stormwatercenter.net/>

Description

Outside process equipment operations and maintenance can contaminate stormwater runoff. Activities, such as grinding, painting, coating, sanding, degreasing or parts cleaning, landfills and waste piles, solid waste treatment and disposal, are examples of process operations that can lead to contamination of stormwater runoff. Source controls for outdoor process equipment operations and maintenance include reducing the amount of waste created, enclosing or covering all or some of the equipment, installing secondary containment, and training employees.

Approach

Pollution Prevention

- Perform the activity during dry periods.
- Use non-toxic chemicals for maintenance and minimize or eliminate the use of solvents.

Suggested Protocols

- Consider enclosing the activity in a building and connecting the floor drains to the sanitary sewer.
- Cover the work area with a permanent roof if possible.
- Minimize contact of stormwater with outside process equipment operations through berming and drainage routing (run-on prevention). If possible, connect process equipment area to public sewer or facility wastewater treatment system. Some municipalities require that secondary containment areas be connected to the sanitary sewer, prohibiting any hard connections to the storm drain.
- Dry clean the work area regularly.

Training

- Train employees to perform the activity during dry periods only or substituting benign materials for more toxic ones.
- Train employee and contractors in proper techniques for spill containment and cleanup. Employees should have the tools and knowledge to immediately begin cleaning up a spill should one occur.

Spill Response and Prevention

- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize

Targeted Constituents

Sediment	✓
Nutrients	
Trash	
Metals	✓
Bacteria	
Oil and Grease	✓
Organics	✓

SC-32 Outdoor Equipment Operations

- Have employees trained in emergency spill cleanup procedures present when dangerous waste, liquid chemicals, or other wastes are delivered.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Prevent operator errors by using engineering safe guards and thus reducing accidental releases of pollutant.
- Inspect storage areas regularly for leaks or spills. Also check for structural failure, spills and overfills due to operator error, and/or failure of piping system.

Other Considerations

- Providing cover may be expensive.
- Space limitations may preclude enclosing some equipment.
- Storage sheds often must meet building and fire code requirements.

Requirements

Costs

Costs vary depending on the complexity of the operation and the amount of control necessary for stormwater pollution control.

Maintenance

- Conduct routine preventive maintenance, including checking process equipment for leaks.
- Clean the storm drain system regularly.

Supplemental Information

Further Detail of the BMP

Hydraulic/Treatment Modifications

If stormwater becomes polluted, it should be captured and treated. If you do not have your own process wastewater treatment system, consider discharging to the public sewer system. Use of the public sewer might be allowed under the following conditions:

- If the activity area is very small (less than a few hundred square feet), the local sewer authority may be willing to allow the area to remain uncovered with the drain connected to the public sewer.
- It may be possible under unusual circumstances to connect a much larger area to the public sewer, as long as the rate of stormwater discharges does not exceed the capacity of the wastewater treatment plant. The stormwater could be stored during the storm and then transferred to the public sewer when the normal flow is low, such as at night.

Industries that generate large volumes of process wastewater typically have their own treatment system and corresponding permit. These industries have the discretion to use their wastewater treatment system to treat stormwater within the constraints of their permit requirements for process treatment. It may also be possible for the industry to discharge the stormwater directly to an effluent outfall without treatment as long as the total loading of the discharged process

water and stormwater does not exceed the loading had a stormwater treatment device been used. This could be achieved by reducing the loading from the process wastewater treatment system. Check with your Regional Water Quality Control Board or local sewerage agency, as this option would be subject to permit constraints and potentially regular monitoring.

The Stormwater Managers Resource Center <http://www.stormwatercenter.net>

Parking/Storage Area Maintenance SC-43

Description

Parking lots and storage areas can contribute a number of substances, such as trash, suspended solids, hydrocarbons, oil and grease, and heavy metals that can enter receiving waters through stormwater runoff or non-stormwater discharges. The protocols in this fact sheet are intended to prevent or reduce the discharge of pollutants from parking/storage areas and include using good housekeeping practices, following appropriate cleaning BMPs, and training employees.

Approach

The goal of this program is to ensure stormwater pollution prevention practices are considered when conducting activities on or around parking areas and storage areas to reduce potential for pollutant discharge to receiving waters. Successful implementation depends on effective training of employees on applicable BMPs and general pollution prevention strategies and objectives.

Pollution Prevention

- Encourage alternative designs and maintenance strategies for impervious parking lots. (See New Development and Redevelopment BMP Handbook)
- Keep accurate maintenance logs to evaluate BMP implementation.

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize
- Product Substitution

Targeted Constituents

Sediment	✓
Nutrients	
Trash	✓
Metals	✓
Bacteria	
Oil and Grease	✓
Organics	✓

SC-43 Parking/Storage Area Maintenance

Suggested Protocols

General

- Keep the parking and storage areas clean and orderly. Remove debris in a timely fashion.
- Allow sheet runoff to flow into biofilters (vegetated strip and swale) and/or infiltration devices.
- Utilize sand filters or oleophilic collectors for oily waste in low quantities.
- Arrange rooftop drains to prevent drainage directly onto paved surfaces.
- Design lot to include semi-permeable hardscape.
- Discharge soapy water remaining in mop or wash buckets to the sanitary sewer through a sink, toilet, clean-out, or wash area with drain.

Controlling Litter

- Post “No Littering” signs and enforce anti-litter laws.
- Provide an adequate number of litter receptacles.
- Clean out and cover litter receptacles frequently to prevent spillage.
- Provide trash receptacles in parking lots to discourage litter.
- Routinely sweep, shovel, and dispose of litter in the trash.

Surface Cleaning

- Use dry cleaning methods (e.g., sweeping, vacuuming) to prevent the discharge of pollutants into the stormwater conveyance system if possible.
- Establish frequency of public parking lot sweeping based on usage and field observations of waste accumulation.
- Sweep all parking lots at least once before the onset of the wet season.
- Follow the procedures below if water is used to clean surfaces:
 - Block the storm drain or contain runoff.
 - Collect and pump wash water to the sanitary sewer or discharge to a pervious surface. Do not allow wash water to enter storm drains.
 - Dispose of parking lot sweeping debris and dirt at a landfill.
- Follow the procedures below when cleaning heavy oily deposits:
 - Clean oily spots with absorbent materials.
 - Use a screen or filter fabric over inlet, then wash surfaces.

Parking/Storage Area Maintenance SC-43

- Do not allow discharges to the storm drain.
- Vacuum/pump discharges to a tank or discharge to sanitary sewer.
- Appropriately dispose of spilled materials and absorbents.

Surface Repair

- Preheat, transfer or load hot bituminous material away from storm drain inlets.
- Apply concrete, asphalt, and seal coat during dry weather to prevent contamination from contacting stormwater runoff.
- Cover and seal nearby storm drain inlets where applicable (with waterproof material or mesh) and manholes before applying seal coat, slurry seal, etc. Leave covers in place until job is complete and all water from emulsified oil sealants has drained or evaporated. Clean any debris from these covered manholes and drains for proper disposal.
- Use only as much water as necessary for dust control, to avoid runoff.
- Catch drips from paving equipment that is not in use with pans or absorbent material placed under the machines. Dispose of collected material and absorbents properly.

Inspection

- Have designated personnel conduct inspections of parking facilities and stormwater conveyance systems associated with parking facilities on a regular basis.
- Inspect cleaning equipment/sweepers for leaks on a regular basis.

Training

- Provide regular training to field employees and/or contractors regarding cleaning of paved areas and proper operation of equipment.
- Train employees and contractors in proper techniques for spill containment and cleanup.

Spill Response and Prevention

- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- Place a stockpile of spill cleanup materials where it will be readily accessible or at a central location.
- Clean up fluid spills immediately with absorbent rags or material.
- Dispose of spilled material and absorbents properly.

Other Considerations

Limitations related to sweeping activities at large parking facilities may include high equipment costs, the need for sweeper operator training, and the inability of current sweeper technology to remove oil and grease.

SC-43 Parking/Storage Area Maintenance

Requirements

Costs

Cleaning/sweeping costs can be quite large. Construction and maintenance of stormwater structural controls can be quite expensive as well.

Maintenance

- Sweep parking lot regularly to minimize cleaning with water.
- Clean out oil/water/sand separators regularly, especially after heavy storms.
- Clean parking facilities regularly to prevent accumulated wastes and pollutants from being discharged into conveyance systems during rainy conditions.

Supplemental Information

Further Detail of the BMP

Surface Repair

Apply concrete, asphalt, and seal coat during dry weather to prevent contamination from contacting stormwater runoff. Where applicable, cover and seal nearby storm drain inlets (with waterproof material or mesh) and manholes before applying seal coat, slurry seal, etc. Leave covers in place until job is complete and all water from emulsified oil sealants has drained or evaporated. Clean any debris from these covered manholes and drains for proper disposal. Only use only as much water as is necessary for dust control to avoid runoff.

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize
- Product Substitution

Targeted Constituents

Sediment	☒
Nutrients	
Trash	☒
Metals	☒
Bacteria	
Oil and Grease	☒
Organics	☒
Oxygen Demanding	☒

Description

Streets, roads, and highways are significant sources of pollutants in stormwater discharges, and operation and maintenance (O&M) practices, if not conducted properly, can contribute to the problem. Stormwater pollution from roadway and bridge maintenance should be addressed on a site-specific basis. Use of the procedures outlined below, that address street sweeping and repair, bridge and structure maintenance, and unpaved roads will reduce pollutants in stormwater.

Approach

Pollution Prevention

- Use the least toxic materials available (e.g. water based paints, gels or sprays for graffiti removal)
- Recycle paint and other materials whenever possible.
- Enlist the help of citizens to keep yard waste, used oil, and other wastes out of the gutter.

Suggested Protocols

Street Sweeping and Cleaning

- Maintain a consistent sweeping schedule. Provide minimum monthly sweeping of curbed streets.
- Perform street cleaning during dry weather if possible.

- Avoid wet cleaning or flushing of street, and utilize dry methods where possible.
- Consider increasing sweeping frequency based on factors such as traffic volume, land use, field observations of sediment and trash accumulation, proximity to water courses, etc. For example:
 - Increase the sweeping frequency for streets with high pollutant loadings, especially in high traffic and industrial areas.
 - Increase the sweeping frequency just before the wet season to remove sediments accumulated during the summer.
 - Increase the sweeping frequency for streets in special problem areas such as special events, high litter or erosion zones.
- Maintain cleaning equipment in good working condition and purchase replacement equipment as needed. Old sweepers should be replaced with new technologically advanced sweepers (preferably regenerative air sweepers) that maximize pollutant removal.
- Operate sweepers at manufacturer requested optimal speed levels to increase effectiveness.
- To increase sweeping effectiveness consider the following:
 - Institute a parking policy to restrict parking in problematic areas during periods of street sweeping.
 - Post permanent street sweeping signs in problematic areas; use temporary signs if installation of permanent signs is not possible.
 - Develop and distribute flyers notifying residents of street sweeping schedules.
- Regularly inspect vehicles and equipment for leaks, and repair immediately.
- If available use vacuum or regenerative air sweepers in the high sediment and trash areas (typically industrial/commercial).
- Keep accurate logs of the number of curb-miles swept and the amount of waste collected.
- Dispose of street sweeping debris and dirt at a landfill.
- Do not store swept material along the side of the street or near a storm drain inlet.
- Keep debris storage to a minimum during the wet season or make sure debris piles are contained (e.g. by berming the area) or covered (e.g. with tarps or permanent covers).

Street Repair and Maintenance

Pavement marking

- Schedule pavement marking activities for dry weather.

- Develop paint handling procedures for proper use, storage, and disposal of paints.
- Transfer and load paint and hot thermoplastic away from storm drain inlets.
- Provide drop cloths and drip pans in paint mixing areas.
- Properly maintain application equipment.
- Street sweep thermoplastic grindings. Yellow thermoplastic grindings may require special handling as they may contain lead.
- Paints containing lead or tributyltin are considered a hazardous waste and must be disposed of properly.
- Use water based paints whenever possible. If using water based paints, clean the application equipment in a sink that is connected to the sanitary sewer.
- Properly store leftover paints if they are to be kept for the next job, or dispose of properly.

Concrete installation and repair

- Schedule asphalt and concrete activities for dry weather.
- Take measures to protect any nearby storm drain inlets and adjacent watercourses, prior to breaking up asphalt or concrete (e.g. place sand bags around inlets or work areas).
- Limit the amount of fresh concrete or cement mortar mixed, mix only what is needed for the job.
- Store concrete materials under cover, away from drainage areas. Secure bags of cement after they are open. Be sure to keep wind-blown cement powder away from streets, gutters, storm drains, rainfall, and runoff.
- Return leftover materials to the transit mixer. Dispose of small amounts of hardened excess concrete, grout, and mortar in the trash.
- Do not wash sweepings from exposed aggregate concrete into the street or storm drain. Collect and return sweepings to aggregate base stockpile, or dispose in the trash.
- When making saw cuts in pavement, use as little water as possible and perform during dry weather. Cover each storm drain inlet completely with filter fabric or plastic during the sawing operation and contain the slurry by placing straw bales, sandbags, or gravel dams around the inlets. After the liquid drains or evaporates, shovel or vacuum the slurry residue from the pavement or gutter and remove from site. Alternatively, a small onsite vacuum may be used to pick up the slurry as this will prohibit slurry from reaching storm drain inlets.
- Wash concrete trucks off site or in designated areas on site designed to preclude discharge of wash water to drainage system.

Patching, resurfacing, and surface sealing

- Schedule patching, resurfacing and surface sealing for dry weather.
- Stockpile materials away from streets, gutter areas, storm drain inlets or watercourses. During wet weather, cover stockpiles with plastic tarps or berm around them if necessary to prevent transport of materials in runoff.
- Pre-heat, transfer or load hot bituminous material away from drainage systems or watercourses.
- Where applicable, cover and seal nearby storm drain inlets (with waterproof material or mesh) and maintenance holes before applying seal coat, slurry seal, etc. Leave covers in place until job is complete and until all water from emulsified oil sealants has drained or evaporated. Clean any debris from covered maintenance holes and storm drain inlets when the job is complete.
- Prevent excess material from exposed aggregate concrete or similar treatments from entering streets or storm drain inlets. Designate an area for clean up and proper disposal of excess materials.
- Use only as much water as necessary for dust control, to avoid runoff.
- Sweep, never hose down streets to clean up tracked dirt. Use a street sweeper or vacuum truck. Do not dump vacuumed liquid in storm drains.
- Catch drips from paving equipment that is not in use with pans or absorbent material placed under the machines. Dispose of collected material and absorbents properly.

Equipment cleaning maintenance and storage

- Inspect equipment daily and repair any leaks. Place drip pans or absorbent materials under heavy equipment when not in use.
- Perform major equipment repairs at the corporation yard, when practical.
- If refueling or repairing vehicles and equipment must be done onsite, use a location away from storm drain inlets and watercourses.
- Clean equipment including sprayers, sprayer paint supply lines, patch and paving equipment, and mud jacking equipment at the end of each day. Clean in a sink or other area (e.g. vehicle wash area) that is connected to the sanitary sewer.

*Bridge and Structure Maintenance**Paint and Paint Removal*

- Transport paint and materials to and from job sites in containers with secure lids and tied down to the transport vehicle.
- Do not transfer or load paint near storm drain inlets or watercourses.

- Test and inspect spray equipment prior to starting to paint. Tighten all hoses and connections and do not overfill paint container.
- Plug nearby storm drain inlets prior to starting painting where there is significant risk of a spill reaching storm drains. Remove plugs when job is completed.
- If sand blasting is used to remove paint, cover nearby storm drain inlets prior to starting work.
- Perform work on a maintenance traveler or platform, or use suspended netting or tarps to capture paint, rust, paint removing agents, or other materials, to prevent discharge of materials to surface waters if the bridge crosses a watercourse. If sanding, use a sander with a vacuum filter bag.
- Capture all clean-up water, and dispose of properly.
- Recycle paint when possible (e.g. paint may be used for graffiti removal activities). Dispose of unused paint at an appropriate household hazardous waste facility.

Grffiti Removal

- Schedule graffiti removal activities for dry weather.
- Protect nearby storm drain inlets prior to removing graffiti from walls, signs, sidewalks, or other structures needing graffiti abatement. Clean up afterwards by sweeping or vacuuming thoroughly, and/or by using absorbent and properly disposing of the absorbent.
- When graffiti is removed by painting over, implement the procedures under Painting and Paint Removal above.
- Direct runoff from sand blasting and high pressure washing (with no cleaning agents) into a landscaped or dirt area. If such an area is not available, filter runoff through an appropriate filtering device (e.g. filter fabric) to keep sand, particles, and debris out of storm drains.
- If a graffiti abatement method generates wash water containing a cleaning compound (such as high pressure washing with a cleaning compound), plug nearby storm drains and vacuum/pump wash water to the sanitary sewer.
- Consider using a waterless and non-toxic chemical cleaning method for graffiti removal (e.g. gels or spray compounds).

Repair Work

- Prevent concrete, steel, wood, metal parts, tools, or other work materials from entering storm drains or watercourses.
- Thoroughly clean up the job site when the repair work is completed.
- When cleaning guardrails or fences follow the appropriate surface cleaning methods (depending on the type of surface) outlined in SC-71 Plaza & Sidewalk Cleaning fact sheet.

- If painting is conducted, follow the painting and paint removal procedures above.
- If graffiti removal is conducted, follow the graffiti removal procedures above.
- If construction takes place, see the Construction Activity BMP Handbook.
- Recycle materials whenever possible.

Unpaved Roads and Trails

- Stabilize exposed soil areas to prevent soil from eroding during rain events. This is particularly important on steep slopes.
- For roadside areas with exposed soils, the most cost-effective choice is to vegetate the area, preferably with a mulch or binder that will hold the soils in place while the vegetation is establishing. Native vegetation should be used if possible.
- If vegetation cannot be established immediately, apply temporary erosion control mats/blankets; a comma straw, or gravel as appropriate.
- If sediment is already eroded and mobilized in roadside areas, temporary controls should be installed. These may include: sediment control fences, fabric-covered triangular dikes, gravel-filled burlap bags, biobags, or hay bales staked in place.

Non-Stormwater Discharges

Field crews should be aware of non-stormwater discharges as part of their ongoing street maintenance efforts.

- Refer to SC-10 Non-Stormwater Discharges
- Identify location, time and estimated quantity of discharges.
- Notify appropriate personnel.

Training

- Train employees regarding proper street sweeping operation and street repair and maintenance.
- Instruct employees and subcontractors to ensure that measures to reduce the stormwater impacts of roadway/bridge maintenance are being followed.
- Require engineering staff and/or consulting A/E firms to address stormwater quality in new bridge designs or existing bridge retrofits.
- Use a training log or similar method to document training.
- Train employees on proper spill containment and clean up, and in identifying non-stormwater discharges.

Spill Response and Prevention

- Refer to SC-11, Spill Prevention, Control & Cleanup.
- Keep your Spill Prevention Control and countermeasure (SPCC) plan up-to-date, and implement accordingly.
- Have spill cleanup materials readily available and in a known location.
- Cleanup spills immediately and use dry methods if possible.
- Properly dispose of spill cleanup material.

Other Considerations

- Densely populated areas or heavily used streets may require parking regulations to clear streets for cleaning.
- No currently available conventional sweeper is effective at removing oil and grease. Mechanical sweepers are not effective at removing finer sediments.
- Limitations may arise in the location of new bridges. The availability and cost of land and other economic and political factors may dictate where the placement of a new bridge will occur. Better design of the bridge to control runoff is required if it is being placed near sensitive waters.

Requirements

Costs

- The maintenance of local roads and bridges is already a consideration of most community public works or transportation departments. Therefore, the cost of pollutant reducing management practices will involve the training and equipment required to implement these new practices.
- The largest expenditures for street sweeping programs are in staffing and equipment. The capital cost for a conventional street sweeper is between \$60,000 and \$120,000. Newer technologies might have prices approaching \$180,000. The average useful life of a conventional sweeper is about four years, and programs must budget for equipment replacement. Sweeping frequencies will determine equipment life, so programs that sweep more often should expect to have a higher cost of replacement.
- A street sweeping program may require the following.
 - Sweeper operators, maintenance, supervisory, and administrative personnel are required.
 - Traffic control officers may be required to enforce parking restrictions.
 - Skillful design of cleaning routes is required for program to be productive.
 - Arrangements must be made for disposal of collected wastes.

- If investing in newer technologies, training for operators must be included in operation and maintenance budgets. Costs for public education are small, and mostly deal with the need to obey parking restrictions and litter control. Parking tickets are an effective reminder to obey parking rules, as well as being a source of revenue.

Maintenance

- Not applicable

Supplemental Information***Further Detail of the BMP******Street sweeping***

There are advantages and disadvantages to the two common types of sweepers. The best choice depends on your specific conditions. Many communities find it useful to have a compliment of both types in their fleet.

Mechanical Broom Sweepers - More effective at picking up large debris and cleaning wet streets. Less costly to purchase and operate. Create more airborne dust.

Vacuum Sweepers - More effective at removing fine particles and associated heavy metals. Ineffective at cleaning wet streets. Noisier than mechanical broom sweepers which may restrict areas or times of operation. May require an advance vehicle to remove large debris.

Street Flushers - Not affected by biggest interference to cleaning, parked cars. May remove finer sediments, moving them toward the gutter and stormwater inlets. For this reason, flushing fell out of favor and is now used primarily after sweeping. Flushing may be effective for combined sewer systems. Presently street flushing is not allowed under most NPDES permits.

Cross-Media Transfer of Pollutants

The California Air Resources Board (ARB) has established state ambient air quality standards including a standard for respirable particulate matter (less than or equal to 10 microns in diameter, symbolized as PM₁₀). In the effort to sweep up finer sediments to remove attached heavy metals, municipalities should be aware that fine dust, that cannot be captured by the sweeping equipment and becomes airborne, could lead to issues of worker and public safety.

Bridges

Bridges that carry vehicular traffic generate some of the more direct discharges of runoff to surface waters. Bridge scupper drains cause a direct discharge of stormwater into receiving waters and have been shown to carry relatively high concentrations of pollutants. Bridge maintenance also generates wastes that may be either directly deposited to the water below or carried to the receiving water by stormwater. The following steps will help reduce the stormwater impacts of bridge maintenance:

- Site new bridges so that significant adverse impacts to wetlands, sensitive areas, critical habitat, and riparian vegetation are minimized.

- Design new bridges to avoid the use of scupper drains and route runoff to land for treatment control. Existing scupper drains should be cleaned on a regular basis to avoid sediment/debris accumulation.
- Reduce the discharge of pollutants to surface waters during maintenance by using suspended traps, vacuums, or booms in the water to capture paint, rust, and paint removing agents. Many of these wastes may be hazardous. Properly dispose of this waste by referring to CA21 (Hazardous Waste Management) in the Construction Handbook.
- Train employees and subcontractors to reduce the discharge of wastes during bridge maintenance.

De-icing

- Do not over-apply deicing salt and sand, and routinely calibrate spreaders.
- Near reservoirs, restrict the application of deicing salt and redirect any runoff away from reservoirs.
- Consider using alternative deicing agents (less toxic, biodegradable, etc.).

United States Environmental Protection Agency (USEPA). 2002. Pollution Prevention/Good Housekeeping for Municipal Operations Roadway and Bridge Maintenance. On-line http://www.epa.gov/npdes/menuofbmeps/poll_13.htm

Description

Landscape maintenance activities include vegetation removal; herbicide and insecticide application; fertilizer application; watering; and other gardening and lawn care practices. Vegetation control typically involves a combination of chemical (herbicide) application and mechanical methods. All of these maintenance practices have the potential to contribute pollutants to the storm drain system. The major objectives of this BMP are to minimize the discharge of pesticides, herbicides and fertilizers to the storm drain system and receiving waters; prevent the disposal of landscape waste into the storm drain system by collecting and properly disposing of clippings and cuttings, and educating employees and the public.

Approach

Pollution Prevention

- Implement an integrated pest management (IPM) program. IPM is a sustainable approach to managing pests by combining biological, cultural, physical, and chemical tools.
- Choose low water using flowers, trees, shrubs, and groundcover.
- Consider alternative landscaping techniques such as naturescaping and xeriscaping.
- Conduct appropriate maintenance (i.e. properly timed fertilizing, weeding, pest control, and pruning) to help preserve the landscapes water efficiency.

Objectives

- Contain
- Educate
- Reduce/Minimize
- Product Substitution

Targeted Constituents

Sediment	☒
Nutrients	☒
Trash	☒
Metals	
Bacteria	
Oil and Grease	
Organics	
Oxygen Demanding	☒

- Consider grass cycling (grass cycling is the natural recycling of grass by leaving the clippings on the lawn when mowing. Grass clippings decompose quickly and release valuable nutrients back into the lawn).

Suggested Protocols***Mowing, Trimming, and Weeding***

- Whenever possible use mechanical methods of vegetation removal (e.g mowing with tractor-type or push mowers, hand cutting with gas or electric powered weed trimmers) rather than applying herbicides. Use hand weeding where practical.
- Avoid loosening the soil when conducting mechanical or manual weed control, this could lead to erosion. Use mulch or other erosion control measures when soils are exposed.
- Performing mowing at optimal times. Mowing should not be performed if significant rain events are predicted.
- Mulching mowers may be recommended for certain flat areas. Other techniques may be employed to minimize mowing such as selective vegetative planting using low maintenance grasses and shrubs.
- Collect lawn and garden clippings, pruning waste, tree trimmings, and weeds. Chip if necessary, and compost or dispose of at a landfill (see waste management section of this fact sheet).
- Place temporarily stockpiled material away from watercourses, and berm or cover stockpiles to prevent material releases to storm drains.

Planting

- Determine existing native vegetation features (location, species, size, function, importance) and consider the feasibility of protecting them. Consider elements such as their effect on drainage and erosion, hardiness, maintenance requirements, and possible conflicts between preserving vegetation and the resulting maintenance needs.
- Retain and/or plant selected native vegetation whose features are determined to be beneficial, where feasible. Native vegetation usually requires less maintenance (e.g., irrigation, fertilizer) than planting new vegetation.
- Consider using low water use groundcovers when planting or replanting.

Waste Management

- Compost leaves, sticks, or other collected vegetation or dispose of at a permitted landfill. Do not dispose of collected vegetation into waterways or storm drainage systems.
- Place temporarily stockpiled material away from watercourses and storm drain inlets, and berm or cover stockpiles to prevent material releases to the storm drain system.
- Reduce the use of high nitrogen fertilizers that produce excess growth requiring more frequent mowing or trimming.

- Avoid landscape wastes in and around storm drain inlets by either using bagging equipment or by manually picking up the material.

Irrigation

- Where practical, use automatic timers to minimize runoff.
- Use popup sprinkler heads in areas with a lot of activity or where there is a chance the pipes may be broken. Consider the use of mechanisms that reduce water flow to sprinkler heads if broken.
- Ensure that there is no runoff from the landscaped area(s) if re-claimed water is used for irrigation.
- If bailing of muddy water is required (e.g. when repairing a water line leak), do not put it in the storm drain; pour over landscaped areas.
- Irrigate slowly or pulse irrigate to prevent runoff and then only irrigate as much as is needed.
- Apply water at rates that do not exceed the infiltration rate of the soil.

Fertilizer and Pesticide Management

- Utilize a comprehensive management system that incorporates integrated pest management (IPM) techniques. There are many methods and types of IPM, including the following:
 - Mulching can be used to prevent weeds where turf is absent, fencing installed to keep rodents out, and netting used to keep birds and insects away from leaves and fruit.
 - Visible insects can be removed by hand (with gloves or tweezers) and placed in soapy water or vegetable oil. Alternatively, insects can be sprayed off the plant with water or in some cases vacuumed off of larger plants.
 - Store-bought traps, such as species-specific, pheromone-based traps or colored sticky cards, can be used.
 - Slugs can be trapped in small cups filled with beer that are set in the ground so the slugs can get in easily.
 - In cases where microscopic parasites, such as bacteria and fungi, are causing damage to plants, the affected plant material can be removed and disposed of (pruning equipment should be disinfected with bleach to prevent spreading the disease organism).
 - Small mammals and birds can be excluded using fences, netting, tree trunk guards.
 - Beneficial organisms, such as bats, birds, green lacewings, ladybugs, praying mantis, ground beetles, parasitic nematodes, trichogramma wasps, seed head weevils, and spiders that prey on detrimental pest species can be promoted.
- Follow all federal, state, and local laws and regulations governing the use, storage, and disposal of fertilizers and pesticides and training of applicators and pest control advisors.

- Use pesticides only if there is an actual pest problem (not on a regular preventative schedule).
- Do not use pesticides if rain is expected. Apply pesticides only when wind speeds are low (less than 5 mph).
- Do not mix or prepare pesticides for application near storm drains.
- Prepare the minimum amount of pesticide needed for the job and use the lowest rate that will effectively control the pest.
- Employ techniques to minimize off-target application (e.g. spray drift) of pesticides, including consideration of alternative application techniques.
- Fertilizers should be worked into the soil rather than dumped or broadcast onto the surface.
- Calibrate fertilizer and pesticide application equipment to avoid excessive application.
- Periodically test soils for determining proper fertilizer use.
- Sweep pavement and sidewalk if fertilizer is spilled on these surfaces before applying irrigation water.
- Purchase only the amount of pesticide that you can reasonably use in a given time period (month or year depending on the product).
- Triple rinse containers, and use rinse water as product. Dispose of unused pesticide as hazardous waste.
- Dispose of empty pesticide containers according to the instructions on the container label.

Inspection

- Inspect irrigation system periodically to ensure that the right amount of water is being applied and that excessive runoff is not occurring. Minimize excess watering, and repair leaks in the irrigation system as soon as they are observed.
- Inspect pesticide/fertilizer equipment and transportation vehicles daily.

Training

- Educate and train employees on use of pesticides and in pesticide application techniques to prevent pollution. Pesticide application must be under the supervision of a California qualified pesticide applicator.
- Train/encourage municipal maintenance crews to use IPM techniques for managing public green areas.
- Annually train employees within departments responsible for pesticide application on the appropriate portions of the agency's IPM Policy, SOPs, and BMPs, and the latest IPM techniques.

- Employees who are not authorized and trained to apply pesticides should be periodically (at least annually) informed that they cannot use over-the-counter pesticides in or around the workplace.
- Use a training log or similar method to document training.

Spill Response and Prevention

- Refer to SC-11, Spill Prevention, Control & Cleanup
- Have spill cleanup materials readily available and in a known location
- Cleanup spills immediately and use dry methods if possible.
- Properly dispose of spill cleanup material.

Other Considerations

- The Federal Pesticide, Fungicide, and Rodenticide Act and California Title 3, Division 6, Pesticides and Pest Control Operations place strict controls over pesticide application and handling and specify training, annual refresher, and testing requirements. The regulations generally cover: a list of approved pesticides and selected uses, updated regularly; general application information; equipment use and maintenance procedures; and record keeping. The California Department of Pesticide Regulations and the County Agricultural Commission coordinate and maintain the licensing and certification programs. All public agency employees who apply pesticides and herbicides in “agricultural use” areas such as parks, golf courses, rights-of-way and recreation areas should be properly certified in accordance with state regulations. Contracts for landscape maintenance should include similar requirements.
- All employees who handle pesticides should be familiar with the most recent material safety data sheet (MSDS) files.
- Municipalities do not have the authority to regulate the use of pesticides by school districts, however the California Healthy Schools Act of 2000 (AB 2260) has imposed requirements on California school districts regarding pesticide use in schools. Posting of notification prior to the application of pesticides is now required, and IPM is stated as the preferred approach to pest management in schools.

Requirements

Costs

Additional training of municipal employees will be required to address IPM techniques and BMPs. IPM methods will likely increase labor cost for pest control which may be offset by lower chemical costs.

Maintenance

Not applicable

Supplemental Information***Further Detail of the BMP******Waste Management***

Composting is one of the better disposal alternatives if locally available. Most municipalities either have or are planning yard waste composting facilities as a means of reducing the amount of waste going to the landfill. Lawn clippings from municipal maintenance programs as well as private sources would probably be compatible with most composting facilities

Contractors and Other Pesticide Users

Municipal agencies should develop and implement a process to ensure that any contractor employed to conduct pest control and pesticide application on municipal property engages in pest control methods consistent with the IPM Policy adopted by the agency. Specifically, municipalities should require contractors to follow the agency's IPM policy, SOPs, and BMPs; provide evidence to the agency of having received training on current IPM techniques when feasible; provide documentation of pesticide use on agency property to the agency in a timely manner.

Objectives

- Contain
- Educate
- Reduce/Minimize

Description

As a consequence of its function, the stormwater conveyance system collects and transports urban runoff that may contain certain pollutants. Maintaining catch basins, stormwater inlets, and other stormwater conveyance structures on a regular basis will remove pollutants, prevent clogging of the downstream conveyance system, restore catch basins' sediment trapping capacity, and ensure the system functions properly hydraulically to avoid flooding.

Approach

Suggested Protocols

Catch Basins/Inlet Structures

- Municipal staff should regularly inspect facilities to ensure the following:
 - Immediate repair of any deterioration threatening structural integrity.
 - Cleaning before the sump is 40% full. Catch basins should be cleaned as frequently as needed to meet this standard.
 - Stenciling of catch basins and inlets (see SC-75 Waste Handling and Disposal).
- Clean catch basins, storm drain inlets, and other conveyance structures in high pollutant load areas just before the wet season to remove sediments and debris accumulated during the summer.

Targeted Constituents

Sediment	☒
Nutrients	☒
Trash	☒
Metals	☒
Bacteria	☒
Oil and Grease	☒
Organics	☒
Oxygen Demanding	☒

SC-74 Drainage System Maintenance

- Conduct inspections more frequently during the wet season for problem areas where sediment or trash accumulates more often. Clean and repair as needed.
- Keep accurate logs of the number of catch basins cleaned.
- Record the amount of waste collected.
- Store wastes collected from cleaning activities of the drainage system in appropriate containers or temporary storage sites in a manner that prevents discharge to the storm drain.
- Dewater the wastes with outflow into the sanitary sewer if permitted. Water should be treated with an appropriate filtering device prior to discharge to the sanitary sewer. If discharge to the sanitary sewer is not allowed, water should be pumped or vacuumed to a tank and properly disposed of. Do not dewater near a storm drain or stream.
- Except for small communities with relatively few catch basins that may be cleaned manually, most municipalities will require mechanical cleaners such as eductors, vacuums, or bucket loaders.

Storm Drain Conveyance System

- Locate reaches of storm drain with deposit problems and develop a flushing schedule that keeps the pipe clear of excessive buildup.
- Collect flushed effluent and pump to the sanitary sewer for treatment.

Pump Stations

- Clean all storm drain pump stations prior to the wet season to remove silt and trash.
- Do not allow discharge from cleaning a storm drain pump station or other facility to reach the storm drain system.
- Conduct quarterly routine maintenance at each pump station.
- Inspect, clean, and repair as necessary all outlet structures prior to the wet season.
- Sample collected sediments to determine if landfill disposal is possible, or illegal discharges in the watershed are occurring.

Open Channel

- Consider modification of storm channel characteristics to improve channel hydraulics, to increase pollutant removals, and to enhance channel/creek aesthetic and habitat value.
- Conduct channel modification/improvement in accordance with existing laws. Any person, government agency, or public utility proposing an activity that will change the natural (emphasis added) state of any river, stream, or lake in California, must enter into a stream or Lake Alteration Agreement with the Department of Fish and Game. The developer-applicant should also contact local governments (city, county, special districts), other state agencies

(SWRCB, RWQCB, Department of Forestry, Department of Water Resources), and Federal Corps of Engineers and USFWS

Illicit Connections and Discharges

- During routine maintenance of conveyance system and drainage structures field staff should look for evidence of illegal discharges or illicit connections:
 - Is there evidence of spills such as paints, discoloring, etc.
 - Are there any odors associated with the drainage system
 - Record locations of apparent illegal discharges/illicit connections
 - Track flows back to potential dischargers and conduct aboveground inspections. This can be done through visual inspection of up gradient manholes or alternate techniques including zinc chloride smoke testing, fluorometric dye testing, physical inspection testing, or television camera inspection.
 - Once the origin of flow is established, require illicit discharger to eliminate the discharge.
- Stencil storm drains, where applicable, to prevent illegal disposal of pollutants. Storm drain inlets should have messages such as “Dump No Waste Drains to Stream” stenciled next to them to warn against ignorant or intentional dumping of pollutants into the storm drainage system.
- Refer to fact sheet SC-10 Non-Stormwater Discharges.

Illegal Dumping

- Regularly inspect and clean up hot spots and other storm drainage areas where illegal dumping and disposal occurs.
- Establish a system for tracking incidents. The system should be designed to identify the following:
 - Illegal dumping hot spots
 - Types and quantities (in some cases) of wastes
 - Patterns in time of occurrence (time of day/night, month, or year)
 - Mode of dumping (abandoned containers, “midnight dumping” from moving vehicles, direct dumping of materials, accidents/spills)
 - Responsible parties
- Post “No Dumping” signs in problem areas with a phone number for reporting dumping and disposal. Signs should also indicate fines and penalties for illegal dumping.
- Refer to fact sheet SC-10 Non-Stormwater Discharges.

SC-74 Drainage System Maintenance

- The State Department of Fish and Game has a hotline for reporting violations called Cal TIP (1-800-952-5400). The phone number may be used to report any violation of a Fish and Game code (illegal dumping, poaching, etc.).
- The California Department of Toxic Substances Control's Waste Alert Hotline, 1-800-69TOXIC, can be used to report hazardous waste violations.

Training

- Train crews in proper maintenance activities, including record keeping and disposal.
- Only properly trained individuals are allowed to handle hazardous materials/wastes.
- Train municipal employees from all departments (public works, utilities, street cleaning, parks and recreation, industrial waste inspection, hazardous waste inspection, sewer maintenance) to recognize and report illegal dumping.
- Train municipal employees and educate businesses, contractors, and the general public in proper and consistent methods for disposal.
- Train municipal staff regarding non-stormwater discharges (See SC-10 Non-Stormwater Discharges).

Spill Response and Prevention

- Refer to SC-11, Prevention, Control & Cleanup
- Have spill cleanup materials readily available and in a known location.
- Cleanup spills immediately and use dry methods if possible.
- Properly dispose of spill cleanup material.

Other Considerations

- Cleanup activities may create a slight disturbance for local aquatic species. Access to items and material on private property may be limited. Trade-offs may exist between channel hydraulics and water quality/riparian habitat. If storm channels or basins are recognized as wetlands, many activities, including maintenance, may be subject to regulation and permitting.
- Storm drain flushing is most effective in small diameter pipes (36-inch diameter pipe or less, depending on water supply and sediment collection capacity). Other considerations associated with storm drain flushing may include the availability of a water source, finding a downstream area to collect sediments, liquid/sediment disposal, and disposal of flushed effluent to sanitary sewer may be prohibited in some areas.
- Regulations may include adoption of substantial penalties for illegal dumping and disposal.
- Municipal codes should include sections prohibiting the discharge of soil, debris, refuse, hazardous wastes, and other pollutants into the storm drain system.
- Private property access rights may be needed to track illegal discharges up gradient.

- Requirements of municipal ordinance authority for suspected source verification testing for illicit connections necessary for guaranteed rights of entry.

Requirements

Costs

- An aggressive catch basin cleaning program could require a significant capital and O&M budget. A careful study of cleaning effectiveness should be undertaken before increased cleaning is implemented. Catch basin cleaning costs are less expensive if vacuum street sweepers are available; cleaning catch basins manually can cost approximately twice as much as cleaning the basins with a vacuum attached to a sweeper.
- Methods used for illicit connection detection (smoke testing, dye testing, visual inspection, and flow monitoring) can be costly and time-consuming. Site-specific factors, such as the level of impervious area, the density and ages of buildings, and type of land use will determine the level of investigation necessary. Encouraging reporting of illicit discharges by employees can offset costs by saving expense on inspectors and directing resources more efficiently. Some programs have used funds available from “environmental fees” or special assessment districts to fund their illicit connection elimination programs.

Maintenance

- Two-person teams may be required to clean catch basins with vactor trucks.
- Identifying illicit discharges requires teams of at least two people (volunteers can be used), plus administrative personnel, depending on the complexity of the storm sewer system.
- Arrangements must be made for proper disposal of collected wastes.
- Requires technical staff to detect and investigate illegal dumping violations, and to coordinate public education.

Supplemental Information

Further Detail of the BMP

Storm Drain flushing

Sanitary sewer flushing is a common maintenance activity used to improve pipe hydraulics and to remove pollutants in sanitary sewer systems. The same principles that make sanitary sewer flushing effective can be used to flush storm drains. Flushing may be designed to hydraulically convey accumulated material to strategic locations, such as to an open channel, to another point where flushing will be initiated, or over to the sanitary sewer and on to the treatment facilities, thus preventing re-suspension and overflow of a portion of the solids during storm events. Flushing prevents “plug flow” discharges of concentrated pollutant loadings and sediments. The deposits can hinder the designed conveyance capacity of the storm drain system and potentially cause backwater conditions in severe cases of clogging.

Storm drain flushing usually takes place along segments of pipe with grades that are too flat to maintain adequate velocity to keep particles in suspension. An upstream manhole is selected to place an inflatable device that temporarily plugs the pipe. Further upstream, water is pumped into the line to create a flushing wave. When the upstream reach of pipe is sufficiently full to

cause a flushing wave, the inflated device is rapidly deflated with the assistance of a vacuum pump, releasing the backed up water and resulting in the cleaning of the storm drain segment.

To further reduce the impacts of stormwater pollution, a second inflatable device, placed well downstream, may be used to re-collect the water after the force of the flushing wave has dissipated. A pump may then be used to transfer the water and accumulated material to the sanitary sewer for treatment. In some cases, an interceptor structure may be more practical or required to re-collect the flushed waters.

It has been found that cleansing efficiency of periodic flush waves is dependent upon flush volume, flush discharge rate, sewer slope, sewer length, sewer flow rate, sewer diameter, and population density. As a rule of thumb, the length of line to be flushed should not exceed 700 feet. At this maximum recommended length, the percent removal efficiency ranges between 65-75 percent for organics and 55-65 percent for dry weather grit/inorganic material. The percent removal efficiency drops rapidly beyond that. Water is commonly supplied by a water truck, but fire hydrants can also supply water. To make the best use of water, it is recommended that reclaimed water be used or that fire hydrant line flushing coincide with storm drain flushing.

Flow Management

Flow management has been one of the principal motivations for designing urban stream corridors in the past. Such needs may or may not be compatible with the stormwater quality goals in the stream corridor.

Downstream flood peaks can be suppressed by reducing through flow velocity. This can be accomplished by reducing gradient with grade control structures or increasing roughness with boulders, dense vegetation, or complex banks forms. Reducing velocity correspondingly increases flood height, so all such measures have a natural association with floodplain open space. Flood elevations laterally adjacent to the stream can be lowered by increasing through flow velocity.

However, increasing velocity increases flooding downstream and inherently conflicts with channel stability and human safety. Where topography permits, another way to lower flood elevation is to lower the level of the floodway with drop structures into a large but subtly excavated bowl where flood flows are allowed to spread out.

Stream Corridor Planning

Urban streams receive and convey stormwater flows from developed or developing watersheds. Planning of stream corridors thus interacts with urban stormwater management programs. If local programs are intended to control or protect downstream environments by managing flows delivered to the channels, then it is logical that such programs should be supplemented by management of the materials, forms, and uses of the downstream riparian corridor. Any proposal for stream alteration or management should be investigated for its potential flow and stability effects on upstream, downstream, and laterally adjacent areas. The timing and rate of flow from various tributaries can combine in complex ways to alter flood hazards. Each section of channel is unique, influenced by its own distribution of roughness elements, management activities, and stream responses.

Flexibility to adapt to stream features and behaviors as they evolve must be included in stream reclamation planning. The amenity and ecology of streams may be enhanced through the landscape design options of 1) corridor reservation, 2) bank treatment, 3) geomorphic restoration, and 4) grade control.

Corridor reservation - Reserving stream corridors and valleys to accommodate natural stream meandering, aggradation, degradation, and over bank flows allows streams to find their own form and generate less ongoing erosion. In California, open stream corridors in recent urban developments have produced recreational open space, irrigation of streamside plantings, and the aesthetic amenity of flowing water.

Bank treatment - The use of armoring, vegetative cover, and flow deflection may be used to influence a channel's form, stability, and biotic habitat. To prevent bank erosion, armoring can be done with rigid construction materials, such as concrete, masonry, wood planks and logs, riprap, and gabions. Concrete linings have been criticized because of their lack of provision of biotic habitat. In contrast, riprap and gabions make relatively porous and flexible linings. Boulders, placed in the bed reduce velocity and erosive power.

Riparian vegetation can stabilize the banks of streams that are at or near a condition of equilibrium. Binding networks of roots increase bank shear strength. During flood flows, resilient vegetation is forced into erosion-inhibiting mats. The roughness of vegetation leads to lower velocity, further reducing erosive effects. Structural flow deflection can protect banks from erosion or alter fish habitat. By concentrating flow, a deflector causes a pool to be scoured in the bed.

Geomorphic restoration – Restoration refers to alteration of disturbed streams so their form and behavior emulate those of undisturbed streams. Natural meanders are retained, with grading to gentle slopes on the inside of curves to allow point bars and riffle-pool sequences to develop. Trees are retained to provide scenic quality, biotic productivity, and roots for bank stabilization, supplemented by plantings where necessary.

A restorative approach can be successful where the stream is already approaching equilibrium. However, if upstream urbanization continues new flow regimes will be generated that could disrupt the equilibrium of the treated system.

Grade Control - A grade control structure is a level shelf of a permanent material, such as stone, masonry, or concrete, over which stream water flows. A grade control structure is called a sill, weir, or drop structure, depending on the relation of its invert elevation to upstream and downstream channels.

A sill is installed at the preexisting channel bed elevation to prevent upstream migration of nick points. It establishes a firm base level below which the upstream channel can not erode.

A weir or check dam is installed with invert above the preexisting bed elevation. A weir raises the local base level of the stream and causes aggradation upstream. The gradient, velocity, and erosive potential of the stream channel are reduced. A drop structure lowers the downstream invert below its preexisting elevation, reducing downstream gradient and velocity. Weirs and drop structure control erosion by dissipating energy and reducing slope velocity.

When carefully applied, grade control structures can be highly versatile in establishing human and environmental benefits in stabilized channels. To be successful, application of grade control structures should be guided by analysis of the stream system both upstream and downstream from the area to be reclaimed.

Examples

The California Department of Water Resources began the Urban Stream Restoration Program in 1985. The program provides grant funds to municipalities and community groups to implement stream restoration projects. The projects reduce damages from streambank and watershed instability and floods while restoring streams' aesthetic, recreational, and fish and wildlife values.

In Buena Vista Park, upper floodway slopes are gentle and grassed to achieve continuity of usable park land across the channel of small boulders at the base of the slopes.

The San Diego River is a large, vegetative lined channel, which was planted in a variety of species to support riparian wildlife while stabilizing the steep banks of the floodway.

Design Objectives

- ☒ Maximize Infiltration
- ☒ Provide Retention
- ☒ Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Irrigation water provided to landscaped areas may result in excess irrigation water being conveyed into stormwater drainage systems.

Approach

Project plan designs for development and redevelopment should include application methods of irrigation water that minimize runoff of excess irrigation water into the stormwater conveyance system.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment. (Detached residential single-family homes are typically excluded from this requirement.)

Design Considerations

Designing New Installations

The following methods to reduce excessive irrigation runoff should be considered, and incorporated and implemented where determined applicable and feasible by the Permittee:

- Employ rain-triggered shutoff devices to prevent irrigation after precipitation.
- Design irrigation systems to each landscape area's specific water requirements.
- Include design featuring flow reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines.
- Implement landscape plans consistent with County or City water conservation resolutions, which may include provision of water sensors, programmable irrigation times (for short cycles), etc.

- Design timing and application methods of irrigation water to minimize the runoff of excess irrigation water into the storm water drainage system.
- Group plants with similar water requirements in order to reduce excess irrigation runoff and promote surface filtration. Choose plants with low irrigation requirements (for example, native or drought tolerant species). Consider design features such as:
 - Using mulches (such as wood chips or bar) in planter areas without ground cover to minimize sediment in runoff
 - Installing appropriate plant materials for the location, in accordance with amount of sunlight and climate, and use native plant materials where possible and/or as recommended by the landscape architect
 - Leaving a vegetative barrier along the property boundary and interior watercourses, to act as a pollutant filter, where appropriate and feasible
 - Choosing plants that minimize or eliminate the use of fertilizer or pesticides to sustain growth
- Employ other comparable, equally effective methods to reduce irrigation water runoff.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define “redevelopment” in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of “redevelopment” must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under “designing new installations” above should be followed.

Other Resources

A Manual for the Standard Urban Stormwater Mitigation Plan (SUSMP), Los Angeles County Department of Public Works, May 2002.

Model Standard Urban Storm Water Mitigation Plan (SUSMP) for San Diego County, Port of San Diego, and Cities in San Diego County, February 14, 2002.

Model Water Quality Management Plan (WQMP) for County of Orange, Orange County Flood Control District, and the Incorporated Cities of Orange County, Draft February 2003.

Ventura Countywide Technical Guidance Manual for Stormwater Quality Control Measures, July 2002.

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- ☒ Prohibit Dumping of Improper Materials
- Contain Pollutants
- Collect and Convey

Description

Waste materials dumped into storm drain inlets can have severe impacts on receiving and ground waters. Posting notices regarding discharge prohibitions at storm drain inlets can prevent waste dumping. Storm drain signs and stencils are highly visible source controls that are typically placed directly adjacent to storm drain inlets.

Approach

The stencil or affixed sign contains a brief statement that prohibits dumping of improper materials into the urban runoff conveyance system. Storm drain messages have become a popular method of alerting the public about the effects of and the prohibitions against waste disposal.

Suitable Applications

Stencils and signs alert the public to the destination of pollutants discharged to the storm drain. Signs are appropriate in residential, commercial, and industrial areas, as well as any other area where contributions or dumping to storm drains is likely.

Design Considerations

Storm drain message markers or placards are recommended at all storm drain inlets within the boundary of a development project. The marker should be placed in clear sight facing toward anyone approaching the inlet from either side. All storm drain inlet locations should be identified on the development site map.

Designing New Installations

The following methods should be considered for inclusion in the project design and show on project plans:

- Provide stenciling or labeling of all storm drain inlets and catch basins, constructed or modified, within the project area with prohibitive language. Examples include “NO DUMPING

– DRAINS TO OCEAN” and/or other graphical icons to discourage illegal dumping.

- Post signs with prohibitive language and/or graphical icons, which prohibit illegal dumping at public access points along channels and creeks within the project area.

Note - Some local agencies have approved specific signage and/or storm drain message placards for use. Consult local agency stormwater staff to determine specific requirements for placard types and methods of application.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define “redevelopment” in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. If the project meets the definition of “redevelopment”, then the requirements stated under “designing new installations” above should be included in all project design plans.

Additional Information

Maintenance Considerations

- Legibility of markers and signs should be maintained. If required by the agency with jurisdiction over the project, the owner/operator or homeowner’s association should enter into a maintenance agreement with the agency or record a deed restriction upon the property title to maintain the legibility of placards or signs.

Placement

- Signage on top of curbs tends to weather and fade.
- Signage on face of curbs tends to be worn by contact with vehicle tires and sweeper brooms.

Supplemental Information

Examples

- Most MS4 programs have storm drain signage programs. Some MS4 programs will provide stencils, or arrange for volunteers to stencil storm drains as part of their outreach program.

Ventura Countywide Technical Guidance Manual for Stormwater Quality Control Measures, July 2002.

Outdoor Liquid Container Storage SC-31

Objectives

- Cover
- Contain
- Educate
- Reduce/Minimize

Description

Accidental releases of materials from above ground liquid storage tanks, drums, and dumpsters present the potential for contaminating stormwaters with many different pollutants. Tanks may store many potential stormwater runoff pollutants, such as gasoline, aviation gas, diesel fuel, kerosene, oils, greases, lubricants and other distilled, blended and refined products derived from crude petroleum. Materials spilled, leaked, or lost from storage tanks may accumulate in soils or on other surfaces and be carried away by rainfall runoff. These source controls apply to containers located outside of a building used to temporarily store liquid materials and include installing safeguards against accidental releases, installing secondary containment, conducting regular inspections, and training employees in standard operating procedures and spill cleanup techniques.

Approach

Pollution Prevention

- Educate employees about pollution prevention measures and goals.
- Keep an accurate, up-to-date inventory of the materials delivered and stored on-site.
- Try to keep chemicals in their original containers, and keep them well labeled.

Suggested Protocols

General

- Develop an operations plan that describes procedures for loading and/or unloading. Refer to SC-30 – Outdoor

Targeted Constituents

Sediment	
Nutrients	✓
Trash	
Metals	✓
Bacteria	
Oil and Grease	✓
Organics	✓

Outdoor Liquid Container Storage SC-31

- Raise the containers off the ground by use of pallet or similar method, with provisions for spill control.
- Contain the material in such a manner that if the container leaks or spills, the contents will not discharge, flow, or be washed into the storm drainage system, surface waters or groundwater.
- Place drip pans or absorbent materials beneath all mounted container taps, and at all potential drip and spill locations during filling and unloading of containers. Any collected liquids or soiled absorbent materials must be reused/recycled or properly disposed.
- Ensure that any underground or aboveground storage tanks are designed and managed in accordance with applicable regulations, identified as a potential pollution source, and have secondary containment such as a berm or dike with an impervious surface.

Inspection

- Provide regular inspections:
 - Inspect storage areas regularly for leaks or spills.
 - Conduct routine inspections and check for external corrosion of material containers. Also check for structural failure, spills and overfills due to operator error, failure of piping system.
 - Check for leaks or spills during pumping of liquids or gases from truck or rail car to a storage facility or vice versa.
 - Visually inspect new tank or container installations for loose fittings, poor welding, and improper or poorly fitted gaskets.
 - Inspect tank foundations, connections, coatings, and tank walls and piping system. Look for corrosion, leaks, cracks, scratches, and other physical damage that may weaken the tank or container system.
 - Replace containers that are leaking, corroded, or otherwise deteriorating with ones in good condition. If the liquid chemicals are corrosive, containers made of compatible materials must be used instead of metal drums.
 - New or secondary containers must be labeled with the product name and hazards.

Training

- Train employee (e.g., fork lift operators) and contractors in proper spill containment and cleanup. The employee should have the tools and knowledge to immediately begin cleaning up a spill if one should occur.
- Train employees in proper storage measures.
- Use a training log or similar method to document training.

SC-31 Outdoor Liquid Container Storage

Loading/Unloading of Materials for more detailed BMP information pertaining to loading and unloading of liquids.

- Protect materials from rainfall, run-on, runoff, and wind dispersal:
 - Cover the storage area with a roof.
 - Minimize stormwater run-on by enclosing the area or building a berm around it.
 - Use a “doghouse” structure for storage of liquid containers.
 - Use covered dumpsters for waste product containers.
- Employ safeguards against accidental releases:
 - Provide overflow protection devices to warn operator or automatic shut down transfer pumps.
 - Provide protection guards (bollards) around tanks and piping to prevent damage from a vehicle or forklift.
 - Provide clear tagging or labeling, and restrict access to valves to reduce human error.
- Berm or surround tank or container with secondary containment system, including dikes, liners, vaults, or double walled tanks.
- Be aware and ready to address the fact that some municipalities require secondary containment areas to be connected to the sanitary sewer, prohibiting any hard connections to the storm drain.
- Contact the appropriate regulatory agency regarding environmental compliance for facilities with “spill ponds” designed to intercept, treat, and/or divert spills.
- Have registered and specifically trained professional engineers identify and correct potential problems such as loose fittings, poor welding, and improper or poorly fitted gaskets for newly installed tank systems.

Storage Areas

- Provide storage tank piping located below product level with a shut-off valve at the tank; ideally this valve should be an automatic shear valve with the shut-off located inside the tank.
- Provide barriers such as posts or guardrails, where tanks are exposed, to prevent collision damage with vehicles.
- Provide secure storage to prevent vandalism-caused contamination.
- Place tight-fitting lids on all containers.
- Enclose or cover the containers where they are stored.

SC-31 Outdoor Liquid Container Storage

Spill Response and Prevention

- Keep your Spill Prevention Control and Countermeasure (SPCC) Plan up-to-date.
- Have an emergency plan, equipment, and trained personnel ready at all times to deal immediately with major spills.
- Collect all spilled liquids and properly dispose of them.
- Have employees trained in emergency spill cleanup procedures present when dangerous waste, liquid chemicals, or other wastes are delivered.
- Prevent operator errors by using engineering safeguards and thus reducing accidental releases of pollutants.
- Store and maintain appropriate spill cleanup materials in a location near the tank storage area and known to all.

Other Considerations

- Storage sheds often must meet building and fire code requirements.
- The local fire district must be consulted for limitations on clearance of roof covers over containers used to store flammable materials.
- All specific standards set by Federal and State laws concerning the storage of oil and hazardous materials must be met.
- Storage of reactive, ignitable, or flammable liquids should comply with the Uniform Fire Code and the National Electric Code.
- Storage of oil and hazardous materials must meet specific Federal and State standards including:
 - Spill Prevention Control and Countermeasure Plan (SPCC) Plan
 - Secondary containment
 - Integrity and leak detection monitoring
 - Emergency preparedness plans

Requirements

Costs

Costs will vary depending on the size of the facility and the necessary controls, such as berms or safeguards against accidental controls.

Maintenance

- Conduct weekly inspection.
- Sweep and clean the storage area regularly if it is paved, do not hose down the area to a storm drain.

Outdoor Liquid Container Storage SC-31

Supplemental Information

The most common causes of unintentional releases are:

- Installation problems
- Failure of piping systems (pipes, pumps, flanges, couplings, hoses, and valves)
- External corrosion and structural failure
- Spills and overfills due to operator error
- Leaks during pumping of liquids or gases from truck or rail car to a storage tank or vice versa

Further Detail of the BMP

Aboveground Tank Leak and Spill Control

Storage of reactive, ignitable, or flammable liquids should comply with the Uniform Fire Code and the National Electric Code. Practices listed below should be employed to enhance the code requirements:

- Tanks should be placed in a designated area.
- Tanks located in areas where firearms are discharged should be encapsulated in concrete or the equivalent.
- Designated areas should be paved with Portland cement concrete, free of cracks and gaps, and impervious in order to contain leaks and spills,
- Liquid materials should be stored in UL approved double walled tanks or surrounded by a curb or dike to provide the volume to contain 10% of the volume of all of the containers or 110% of the volume of the largest container, whichever is greater. The area inside the curb should slope to a drain.
- For used oil or dangerous waste, a dead-end sump should be installed in the drain.
- All other liquids should be drained to the sanitary sewer if available. The drain must have a positive control such as a lock, valve, or plug to prevent release of contaminated liquids.
- Accumulated stormwater in petroleum storage areas should be passed through an oil/water separator

Maintenance is critical to preventing leaks and spills. Conduct routine weekly inspections and:

- Check for external corrosion and structural failure.
- Check for spills and overfills due to operator error.
- Check for failure of piping system (pipes, pumps, flanger, coupling, hoses, and valves).
- Check for leaks or spills during pumping of liquids or gases from truck or rail car to a storage facility or vice versa

SC-31 Outdoor Liquid Container Storage

- Inspect new tank or container installation visually for loose fittings, poor welding, and improper or poorly fitted gaskets.
- Inspect tank foundations, connections, coatings, and tank walls and piping system. Look for corrosion, leaks, cracks, scratches, and other physical damage that may weaken the tank or container system.
- Frequently release accumulated stormwater during the wet season.
- Have periodic integrity testing conducted by a qualified professional.

Container Management

- To limit the possibility of stormwater pollution, containers used to store dangerous waste or other liquids should be kept inside the building unless this is impractical due to site constraints. If the containers are placed outside, the following procedures should be employed:
 - Dumpsters used to store items awaiting transfer to a landfill should be placed in a lean-to structure or otherwise covered. Dumpsters shall be kept in good condition without corrosion or leaky seams.
 - Garbage dumpsters shall be replaced if they are deteriorating to the point where leakage is occurring. Dumpsters should be kept undercover to prevent the entry of stormwater. Employees should be made aware of the importance of keeping the dumpsters covered and free from leaks.
 - Waste container drums should be kept in an area such as a service bay. If drums are kept outside, they must be stored in a lean-to type structure, shed or walk-in container to keep rainfall from reaching the drums.

Dikes

One of the best protective measures against contamination of stormwater is diking. Containment dikes are berms or retaining walls that are designed to hold spills. Diking is an effective pollution prevention measure for above ground storage tanks and railcar or tank truck loading and unloading areas. The dike surrounds the area of concern and holds the spill, keeping spill materials separated from the stormwater side of the dike area. Diking can be used in any industrial or municipal facility, but it is most commonly used for controlling large spills or releases from liquid storage areas and liquid transfer areas.

- For single-wall tanks, containment dikes should be large enough to hold the contents of the storage tank for the facility plus rain water.
- For trucks, diked areas should be capable of holding an amount equal to the volume of the tank truck compartment. Diked construction material should be strong enough to safely hold spilled materials.
- Dike materials can consist of earth, concrete, synthetic materials, metal, or other impervious materials.
- Strong acids or bases may react with metal containers, concrete, and some plastics.

Outdoor Liquid Container Storage SC-31

- Where strong acids or bases are stored, alternative dike materials should be considered. More active organic chemicals may need certain special liners for dikes.
- Dikes may also be designed with impermeable materials to increase containment capabilities.
- Dikes should be inspected during or after significant storms or spills to check for washouts or overflows.
- Regular checks of containment dikes to insure the dikes are capable of holding spills should be conducted.
- Inability of a structure to retain stormwater, dike erosion, soggy areas, or changes in vegetation indicate problems with dike structures. Damaged areas should be patched and stabilized immediately.
- Earthen dikes may require special maintenance of vegetation such as mulching and irrigation.

Curbing

Curbing is a barrier that surrounds an area of concern. Curbing is similar to containment diking in the way that it prevents spills and leaks from being released into the environment. Curbing is usually small scaled and does not contain large spills like diking. Curbing is common at many facilities in small areas where handling and transfer of liquid materials occur. Curbing can redirect contaminated stormwater away from the storage area. It is useful in areas where liquid materials are transferred from one container to another. Asphalt is a common material used for curbing; however, curbing materials can include earth, concrete, synthetic materials, metal, or other impenetrable materials.

- Spilled materials should be removed immediately from curbed areas to allow space for future spills.
- Curbs should have manually-controlled pump systems rather than common drainage systems for collection of spilled materials.
- The curbed area should be inspected regularly to clear clogging debris.
- Maintenance should also be conducted frequently to prevent overflow of any spilled materials as curbed areas are designed only for smaller spills.
- Curbing has the following advantages:
 - Excellent run-on control
 - Inexpensive
 - Ease of installment
 - Provides option to recycle materials spilled in curb areas
 - Common industry practice

SC-31 Outdoor Liquid Container Storage

Examples

The “doghouse” design has been used to store small liquid containers. The roof and flooring design prevent contact with direct rain or runoff. The doghouse has two solid structural walls and two canvas covered walls. The flooring is wire mesh about secondary containment. The unit has been used successfully at Lockheed Missile and Space Company in Sunnyvale.

Santa Clara Valley Urban Runoff Pollution Prevention Program <http://www.scvurppp.org>

The Storm Water Managers Resource Center <http://www.stormwatercenter.net/>

Description

Trash storage areas are areas where a trash receptacle (s) are located for use as a repository for solid wastes. Stormwater runoff from areas where trash is stored or disposed of can be polluted. In addition, loose trash and debris can be easily transported by water or wind into nearby storm drain inlets, channels, and/or creeks. Waste handling operations that may be sources of stormwater pollution include dumpsters, litter control, and waste piles.

Approach

This fact sheet contains details on the specific measures required to prevent or reduce pollutants in stormwater runoff associated with trash storage and handling. Preventative measures including enclosures, containment structures, and impervious pavements to mitigate spills, should be used to reduce the likelihood of contamination.

Suitable Applications

Appropriate applications include residential, commercial and industrial areas planned for development or redevelopment. (Detached residential single-family homes are typically excluded from this requirement.)

Design Considerations

Design requirements for waste handling areas are governed by Building and Fire Codes, and by current local agency ordinances and zoning requirements. The design criteria described in this fact sheet are meant to enhance and be consistent with these code and ordinance requirements. Hazardous waste should be handled in accordance with legal requirements established in Title 22, California Code of Regulation.

Wastes from commercial and industrial sites are typically hauled by either public or commercial carriers that may have design or access requirements for waste storage areas. The design criteria in this fact sheet are recommendations and are not intended to be in conflict with requirements established by the waste hauler. The waste hauler should be contacted prior to the design of your site trash collection areas. Conflicts or issues should be discussed with the local agency.

Designing New Installations

Trash storage areas should be designed to consider the following structural or treatment control BMPs:

- Design trash container areas so that drainage from adjoining roofs and pavement is diverted around the area(s) to avoid run-on. This might include berming or grading the waste handling area to prevent run-on of stormwater.
- Make sure trash container areas are screened or walled to prevent off-site transport of trash.

Design Objectives

- Maximize Infiltration
- Provide Retention
- Slow Runoff
- Minimize Impervious Land Coverage
- Prohibit Dumping of Improper Materials
- ☒ Contain Pollutants
- Collect and Convey

- Use lined bins or dumpsters to reduce leaking of liquid waste.
- Provide roofs, awnings, or attached lids on all trash containers to minimize direct precipitation and prevent rainfall from entering containers.
- Pave trash storage areas with an impervious surface to mitigate spills.
- Do not locate storm drains in immediate vicinity of the trash storage area.
- Post signs on all dumpsters informing users that hazardous materials are not to be disposed of therein.

Redeveloping Existing Installations

Various jurisdictional stormwater management and mitigation plans (SUSMP, WQMP, etc.) define “redevelopment” in terms of amounts of additional impervious area, increases in gross floor area and/or exterior construction, and land disturbing activities with structural or impervious surfaces. The definition of “redevelopment” must be consulted to determine whether or not the requirements for new development apply to areas intended for redevelopment. If the definition applies, the steps outlined under “designing new installations” above should be followed.

Additional Information***Maintenance Considerations***

The integrity of structural elements that are subject to damage (i.e., screens, covers, and signs) must be maintained by the owner/operator. Maintenance agreements between the local agency and the owner/operator may be required. Some agencies will require maintenance deed restrictions to be recorded of the property title. If required by the local agency, maintenance agreements or deed restrictions must be executed by the owner/operator before improvement plans are approved.

The Ocean Begins at Your Front Door

M-129

Follow these simple steps to help reduce water pollution:

Household Activities

- Do not rinse spills with water. Use dry cleanup methods such as applying cat litter or another absorbent material, sweep and dispose of in the trash. Take items such as used or excess batteries, oven cleaners, automotive fluids, painting products and cathode ray tubes, like TVs and computer monitors, to a Household Hazardous Waste Collection Center (HHWCC).
- For a HHWCC near you call (714) 834-6752 or visit www.oclandfills.com.
- Do not hose down your driveway, sidewalk or patio to the street, gutter or storm drain. Sweep up debris and dispose of it in the trash.

Automotive

- Take your vehicle to a commercial car wash whenever possible. If you wash your vehicle at home, choose soaps, cleaners, or detergents labeled non-toxic, phosphate-free or biodegradable. Vegetable and citrus-based products are typically safest for the environment.
- Do not allow washwater from vehicle washing to drain into the street, gutter or storm drain. Excess washwater should be disposed of in the sanitary sewer (through a sink or toilet) or onto an absorbent surface like your lawn.
- Monitor your vehicles for leaks and place a pan under leaks. Keep your vehicles well maintained to stop and prevent leaks.
- Never pour oil or antifreeze in the street, gutter or storm drain. Recycle these substances at a service station, a waste oil collection center or used oil recycling center. For the nearest Used Oil Collection Center call 1-800-CLEANUP or visit www.1800cleanup.org.

Pool Maintenance

- Pool and spa water must be dechlorinated and free of excess acid, alkali or color to be allowed in the street, gutter or storm drain.
- When it is not raining, drain dechlorinated pool and spa water directly into the sanitary sewer.
- Some cities may have ordinances that do not allow pool water to be disposed of in the storm drain. Check with your city.

Landscape and Gardening

- Do not over-water. Water your lawn and garden by hand to control the amount of water you use or set irrigation systems to reflect seasonal water needs. If water flows off your yard onto your driveway or sidewalk, your system is over-watering. Periodically inspect and fix leaks and misdirected sprinklers.
- Do not rake or blow leaves, clippings or pruning waste into the street, gutter or storm drain. Instead, dispose of waste by composting, hauling it to a permitted landfill, or as green waste through your city's recycling program.
- Follow directions on pesticides and fertilizer, (measure, do not estimate amounts) and do not use if rain is predicted within 48 hours.
- Take unwanted pesticides to a HHWCC to be recycled. For locations and hours of HHWCC, call (714) 834-6752 or visit www.oclandfills.com.

Trash

- Place trash and litter that cannot be recycled in securely covered trash cans.
- Whenever possible, buy recycled products.
- Remember: Reduce, Reuse, Recycle.

Pet Care

- Always pick up after your pet. Flush waste down the toilet or dispose of it in the trash. Pet waste, if left outdoors, can wash into the street, gutter or storm drain.
- If possible, bathe your pets indoors. If you must bathe your pet outside, wash it on your lawn or another absorbent/permeable surface to keep the washwater from entering the street, gutter or storm drain.
- Follow directions for use of pet care products and dispose of any unused products at a HHWCC.

Common Pollutants

Home Maintenance

- Detergents, cleaners and solvents
- Oil and latex paint
- Swimming pool chemicals
- Outdoor trash and litter

Lawn and Garden

- Pet and animal waste
- Pesticides
- Clippings, leaves and soil
- Fertilizer

Automobile

- Oil and grease
- Radiator fluids and antifreeze
- Cleaning chemicals
- Brake pad dust

The Ocean Begins at Your Front Door

Never allow pollutants to enter the street, gutter or storm drain!

Did You Know?

- Most people believe that the largest source of water pollution in urban areas comes from specific sources such as factories and sewage treatment plants. In fact, the largest source of water pollution comes from city streets, neighborhoods, construction sites and parking lots. This type of pollution is sometimes called “non-point source” pollution.
- There are two types of non-point source pollution: stormwater and urban runoff pollution.
- Stormwater runoff results from rainfall. When rainstorms cause large volumes of water to rinse the urban landscape, picking up pollutants along the way.
- Urban runoff can happen any time of the year when excessive water use from irrigation, vehicle washing and other sources carries trash, lawn clippings and other urban pollutants into storm drains.

Where Does It Go?

- Anything we use outside homes, vehicles and businesses – like motor oil, paint, pesticides, fertilizers and cleaners – can be blown or washed into storm drains.
- A little water from a garden hose or rain can also send materials into storm drains.
- Storm drains are separate from our sanitary sewer systems; unlike water in sanitary sewers (from sinks or toilets), water in storm drains is not treated before entering our waterways.

Sources of Non-Point Source Pollution

- Automotive leaks and spills.
- Improper disposal of used oil and other engine fluids.
- Metals found in vehicle exhaust, weathered paint, rust, metal plating and tires.
- Pesticides and fertilizers from lawns, gardens and farms.
- Improper disposal of cleaners, paint and paint removers.
- Soil erosion and dust debris from landscape and construction activities.
- Litter, lawn clippings, animal waste, and other organic matter.
- Oil stains on parking lots and paved surfaces.

The Effect on the Ocean

Non-point source pollution can have a serious impact on water quality in Orange County. Pollutants from the storm drain system can harm marine life

as well as coastal and wetland habitats. They can also degrade recreation areas such as beaches, harbors and bays.

Stormwater quality management programs have been developed throughout Orange County to educate and encourage the public to protect water quality, monitor runoff in the storm drain system, investigate illegal dumping and maintain storm drains.

Support from Orange County residents and businesses is needed to improve water quality and reduce urban runoff pollution. Proper use and disposal of materials will help stop pollution before it reaches the storm drain and the ocean.

Subject: Preliminary Geotechnical Investigation

Proposed Brea Mall Development

1066 Brea Mall

Brea, California 92821

PSI Project No. 00661261

Dear Mr. Poynter;

As requested, Professional Service Industries, Inc. (PSI), an Intertek Company, is pleased to provide this report summarizing our Preliminary Geotechnical Investigation for the above referenced project in Brea, California. This report includes the results of our review of published and unpublished geologic information, subsurface exploration, laboratory testing, and our preliminary conclusions and recommendations as they pertain to the proposed development of the property.

We appreciate the opportunity to perform this Preliminary Geotechnical Investigation and look forward to continued participation during the design and construction phases of this project. If you have any questions pertaining to this report, or if we may be of further service, please contact our office.

Respectfully submitted,

PROFESSIONAL SERVICE INDUSTRIES, INC.

Douglas T. Abernathy, PE, GE
Senior Project Engineer

Robert R. Russell, PE
Principal Consultant

1 PROJECT INFORMATION

1.1 PROJECT AUTHORIZATION

Professional Service Industries, Inc. (PSI) has completed a Preliminary Geotechnical Investigation for the proposed Brea Mall Development to be located in the southwest corner of the Brea Mall property in Brea, California. Our work was performed in general accordance with our proposal revised January 22, 2018 and signed February 2, 2018.

1.2 PROJECT DESCRIPTION

PSI understands that conceptually the site is proposed to be improved with several buildings ranging from 3,000 square feet (sf) to 120,000 sf along with a 5 to 6-Level parking garage holding 1,000 to 1,300 vehicles. Development of the site will also include paving, hardscape, landscaping, utilities, possibly a pool, and various other improvements. The existing Sears store is proposed to be demolished. Grading plans have not been developed but we assume grades will remain relatively level with minor adjustments of less than ± 2 feet as the site consists of an active mall and parking lots. The proposed developments may have maximum column loadings of roughly 150 to 200 kips for one-story, 200 to 250 kips for two-story, and 300 to 400 kips for three-story structures. The parking structure may induce loadings of 750 to 1,000 kips. Wall loadings are anticipated to be 3 to 15 kips/ft. Shallow foundations including slab-on-grade construction is anticipated. Slabs may support loadings of up to 150 pounds per square foot.

The preliminary geotechnical recommendations presented in this report are based on the available project information, site location, laboratory testing, and the subsurface materials encountered. If any of the noted information is incorrect, please inform PSI in writing so that we may amend the recommendations presented in this report if appropriate and if desired by the client. PSI will not be responsible for the implementation of its recommendations when it is not notified of changes to the project. We understand that future, more detailed plans and designs are proposed and therefore, more detailed geotechnical investigations will need to be performed for select buildings.

1.3 PURPOSE AND SCOPE OF SERVICES

The purpose of this preliminary geotechnical investigation was to explore the subsurface conditions and provide suitable preliminary design recommendations for the proposed developments. The investigation for this project involved drilling six geotechnical soil borings, perform percolation testing in two of the borings, laboratory testing, and geotechnical analyses. This report briefly outlines the testing procedures, presents available project information,

describes the site and subsurface conditions, and presents preliminary geotechnical recommendations for the following:

- Seismic hazards on the property;
- Site preparation and grading;
- General foundation types, depths, allowable bearing capacities, and estimates of settlement;
- Concrete floor slabs;
- Paving recommendations;
- Retaining wall recommendations;
- Percolation test results; and
- Comments regarding factors that may impact construction and performance of the proposed development.

This report is **not** intended to be used for final design purposes. Additional geotechnical investigations will be necessary based on future grading plans and foundation plans proposed for the development.

The scope of services did not include environmental assessments for determining the presence or absence of wetlands, or hazardous or toxic materials in the soil, surface water, groundwater, or air on or below, or around this site. Any statements in this report or on the boring logs regarding odors, colors, and unusual or suspicious items or conditions are strictly for informational purposes. PSI can perform Phase I/ESA, asbestos, lead, and mold surveys of the existing site improvements and property if desired with an additional budget.

2 SITE AND SUBSURFACE CONDITIONS

2.1 SITE LOCATION AND DESCRIPTION

The project site is situated at 1066 Brea Mall in Brea, California in the southwest corner of the mall property. The proposed development spans across an area of roughly 800-feet by 800-feet. The property is bounded to the west by Randolph Avenue, to the south by other commercial developments and Imperial Highway and State College Boulevard, to the east by parking areas, and to the north and east by the main mall development. At the time of our fieldwork, the site consisted of an existing two to three-story Sears store with surface parking areas, drive aisles, landscaping, hardscaping, and a roughly 15-foot high slope. The site appears to slope to the southwest with elevations (estimated from Google Earth) ranging from roughly 330 to 350 feet above mean sea level. The site is located at approximate latitude 33.9137° and longitude -117.8883°. A Site Vicinity Map showing the site location is included as Figure 1.

2.2 PREVIOUS INVESTIGATIONS

Previously Converse Consultants Orange County (Converse) performed several geotechnical investigations for the mall development as listed below:

Table 1 – Converse Consultants Reports

Year	Report
1974	Original geotechnical report for the mall development.
1974 – 1978	Grading reports for earthwork.
1975	Fill compaction reports.
1977	Fill compaction reports.
1978	Geotechnical investigation for Nordstrom.
1980	Geotechnical investigation for restaurant on perimeter access road on State College Boulevard.
1984	Geotechnical investigation for repaving perimeter road, south and east.
1985	Geotechnical investigation for hotel and parking structure on Bristol St.
1986	Geotechnical investigation for restaurant on perimeter access road on State College Boulevard.
1987	Geotechnical investigation for mall expansion to northwest and southeast.

The 1987 report describes encountering compacted fill and native terrace deposits. Soils encountered by Converse predominantly consisted of sandy clay beneath the site. Other soils were also encountered including silty sand, clayey sand, clay, silt, and sandy silt. The majority of the fill soils were encountered southwest of the Macy's store (5 to 33 feet bgs). Relatively moderate amounts of fill were encountered beneath the parking structure west of Nordstrom (0 to 13 feet bgs). Groundwater was described by Converse as being deeper than 50 feet bgs (Orange County Water District, 1976) with perched water encountered at depths ranging from 23½ to 42½ feet bgs. Existing pavements consisted of roughly 3 inches of asphalt concrete over 4 inches of aggregate base. Sulfate testing of the soils indicated 160 to 224 ppm. Expansion index testing (generally 40 to 50) indicated low to medium expansion potential. R-values ranged from 6 to 13 for sandy clay and clayey sand respectively.

2.3 REGIONAL GEOLOGY

The site is located within the La Habra 7½ minute quadrangle within the Los Angeles Basin Geomorphic Province boundary. Based on a review of the Dibblee Geologic Map of the area (2001), the site is underlain by elevated older alluvial deposits. Areas nearby (outside the proposed development area) to the southwest and southeast consist of younger alluvium that is considered potentially liquefiable.

2.4 REGIONAL SEISMICITY

The project site is located in Southern California, which has undergone a complex multiphase structural history and remains an active tectonic region with documented historic earthquakes. Generally, the seismicity within California can be attributed to faulting due to regional tectonic movement. This includes the San Andreas Fault and other sub-parallel strike-slip faults, as well as normal and thrust faulting within the State. The area of the subject site is considered seismically active. Seismic hazards within the area can be attributed to potential ground shaking resulting from earthquake events along nearby or more distant faulting.

2.5 SEISMIC HAZARD ASSESSMENT

2.5.1 Alquist-Priolo Fault Zone

The seismicity of the site was evaluated utilizing deterministic methods for active faults within the regional vicinity. According to the Alquist-Priolo Special Studies Zones Act of 1972 (revised

1994) faults have been classified as active faults which show apparent movement during the last 11,000 years (i.e., Holocene time). The site is not located within a currently designated Earthquake Fault Zone per the Alquist-Priolo Special Studies Zone Map produced by the California Geological Survey (CGS). Based on CGS mapping, the closest active fault is the Whittier Fault (Elsinore fault zone, Whittier section) located approximately 1.7 miles to the northeast from the site.

2.5.2 Liquefaction-Induced Settlement

The primary causes of damage in this general area during seismic events include ground shaking and liquefaction of the subsurface strata. Liquefaction occurs when loose granular and low plastic materials below the groundwater table are subjected to cyclic shear forces resulting from seismic events. Water pressure within the pore spaces of the soil increases with a corresponding decrease in the soil's effective stress and individual grains of soil lose contact with each other. Excess pore pressures ultimately dissipate and the soil consolidates, often causing significant total and differential settlement of the ground surface.

Liquefaction potential is greatest where the ground water level is shallow and submerged loose fine sands and silts and soft low plasticity clays occur within a depth of about 50 feet or less. Liquefaction potential decreases as grain size and clay and gravel content increase. As ground acceleration and shaking duration increase during an earthquake, liquefaction potential increases.

A review of the California Geologic Survey (CGS) map indicates that the site is not in an area designated as having a liquefaction potential. Areas of potentially liquefiable younger alluvium exist to the southwest and southeast offsite. Liquefaction analyses were performed onsite at one boring location due to high groundwater levels and questionable soil strengths. Our liquefaction analysis indicates that a zone of poorly graded sand between depths of 33 to 37 feet bgs may liquefy during the design earthquake with high groundwater levels. Seismic settlements induced from such liquefaction may result in 0.7-inch of displacement with an estimated differential settlement of less than ½ inch over a 40 foot span. Our liquefaction analysis is provided in Appendix D.

We do not believe lateral spreading or surficial disturbances will be an issue at this site due to potential liquefaction.

2.5.3 Landsliding

A review of the CGS map indicates that the site is not in an area designated as having a landslide potential. Due to the generally flat nature of the site and surrounding properties, it is our opinion that the site is not susceptible to landsliding.

2.5.4 Tsunamis and Seiches

Inundation by tsunamis (seismic or "tidal waves") are not likely to be considered a significant threat to the subject site due to the distance from the coast. The elevation of the project site is also significantly above sea level. Based on there being no bodies of water near the site, the site is also not considered subject to seiches.

2.6 SUBSURFACE CONDITIONS

2.6.1 GENERAL

The boring locations were marked in the field by a PSI representative by referencing existing landmarks based on the information provided by the client. A truck-mounted drill rig and continuous flight, hollow-stem augers were used to advance the soil borings.

During the sampling procedure, Standard Penetration Tests (SPT) were performed in accordance with ASTM D1586 and relatively undisturbed samples were obtained in general accordance with ASTM D3550. The SPT for soil borings is performed by driving a split-spoon sampler, with an outside diameter of 2 inches, into the undisturbed formation located at the bottom of the advanced borehole with repeated blows of a 140-pound hammer falling a vertical distance of 30 inches. The number of blows required to drive the sampler the last 12 inches of an 18-inch penetration depth is a measure of the soil consistency (N-value). If 50 blows are performed before reaching the end of a 6 inch increment this is referred to as refusal and the number of blow per inches driven is recorded, i.e. 50/4 inches. For ASTM D3550 (California Modified Sampler) the split barrel sampler possesses a 3-inch O.D. and is driven in the same manner as the SPT. The field blow counts obtained from the California Modified sampler, as indicated in the boring logs, were adjusted by 63 percent to obtain a rough correlation to SPT blow counts (SPT-N value). Samples were identified in the field, placed in sealed containers and transported to the laboratory for further classification and testing.

2.6.2 SOIL BORINGS

The subsurface conditions were explored by drilling six soil borings (B1 through B6) at the site for geotechnical exploration purposes. Two borings (B1 and B2) were drilled closer to the mall for correlations with previous borings performed by Converse Consultants in 1987. Two borings (B3 and B4) were drilled in the southwest region of the proposed development to depths of approximately 51½ feet below the ground surface (bgs) for purposes of liquefaction analysis. Percolation testing was also performed near these two borings (B3 and B4) to depths of 10 feet bgs. Two borings (B5 and B6) were drilled to depths of 31½ feet at mid-elevation portions of the site for general geotechnical analysis. Figure 2 shows the approximate boring locations. The soil types encountered at the specific boring locations are presented on the attached Boring Logs provided in Appendix A.

As indicated on the boring logs, the subsurface soils consisted of many types of soils ranging from sands to silts to clays and combinations of each. Coarse grained soils had relative densities ranging from loose to very dense while fine grained soils had consistencies ranging from soft to hard. Fill was encountered at boring locations B1 (2.3 feet bgs) and B2 (2½ feet bgs). Possible fill was encountered at boring locations B1 (2.3 to 4.7 feet bgs), B3 (1½ to 7 feet bgs), and B4 (0.8 to 5 feet bgs). Near surface loose and soft soils were encountered at boring locations B1 (1½ to 9 feet bgs) and B3 (4.7 to 7 feet bgs).

The stratification presented on the boring logs is based on a visual examination of the recovered soil samples and the interpretation of field logs by a geotechnical professional. Included on the boring logs are the standard penetration resistances (SPT N-values and California Modified sampler blows) recorded in the individual borings at standard testing intervals to the boring termination depths.

The above subsurface description is of a generalized nature to highlight the major subsurface stratification features and material characteristics. The boring logs, included in Appendix A, should be reviewed for specific information at individual boring locations. These records include soil descriptions, stratification, penetration resistance, locations of the samples and laboratory test data. The stratification shown on the boring logs represents the conditions only at the actual boring locations at the time of our exploration. Variations may occur and should be expected between boring locations. The stratification that represents the approximate boundary between subsurface materials and the actual transition may be gradual.

2.7 GROUNDWATER

Groundwater was encountered in two of our soil borings during our investigation at depths ranging from approximately 25 feet bgs (at boring location B4) to 30 feet bgs (at boring location B3). These depths are approximate as the drilling operations continued and monitoring equipment was not installed. Groundwater is not expected to impact the proposed construction. It is possible, however, that transient, saturated ground conditions at shallower depths could develop at a later time due to periods of heavy precipitation, landscape watering, leaking water lines, or other unforeseen causes. Variations in groundwater levels should be expected seasonally, annually, and from location to location.

2.8 LABORATORY TESTING

The soil samples obtained during the field exploration were transported to our laboratory and selected soil samples were tested in the laboratory to determine the material properties for evaluation. Laboratory testing on selected samples included moisture content (ASTM D2216), density (ASTM D2937), grain size distribution (ASTM D422), Atterberg Limits (ASTM D4318), expansion index (ASTM D4829), R-value (CTM 301), consolidation (ASTM D2435), direct shear (ASTM D3080), and corrosion testing [soluble sulfate (CTM 417), soluble chloride (CTM 422), pH (ASTM D4972), and minimum resistivity (CTM 643)]. Laboratory testing was performed in general accordance with ASTM and Caltrans procedures. Unless otherwise informed, the soil samples will be discarded 60 days from the issuance of this report. Laboratory test results are included in Appendix B.

2.9 PERCOLATION TESTING

A limited program of in-situ percolation testing was performed at two boring locations [B3(P1) and B4(P2)] as shown on Figure 2. Testing was performed in general accordance with the Technical Guidance Document for the Preparation of Conceptual/Preliminary and/or Project Water Quality Management Plans for the Santa Ana Regional Water Quality Control Board (September, 2013). Results of the testing are provided below in Table 1 and are attached in an Appendix C.

Table 2 – Percolation Test Results

Test Location	Raw Infiltration Rate (in/hr)	Design Infiltration Rate (in/hr)
P1 (B3)	0.0	0.0
P2 (B4)	2.8	1.4

Measured percolation rates were reduced to determine design values that will represent long-term performance of the proposed infiltration BMPs. The recommended factor values used were obtained from the Technical Guidance Document referenced above. We have assumed that maintenance of the designed system will be performed regularly. The following assumptions were made:

Table 3 – Percolation Assumptions

Factor Category	Factor Description	Factor Value Location P1/B3	Factor Value Location P2/B4
Suitability Assessment	Soil Assessment Methods	2	2
	Predominant Soil Texture	3	1
	Site Soil Variability	4	2
	Depth to Groundwater or Impervious Layer	1	1
Design	Tributary Area Size	1	1
	Level of Pretreatment	1	1
	Redundancy	1	1
	Compaction During Constr.	1	1
Combined FS	$\sum S_{Total}$	2	1.5
Measured Rate	(in/hr)	0.0	2.8
Design Rate	(in/hr)	0.0	1.4

Use a minimum FS of 2 for design

Please note that percolation/infiltration rates are representative of the location and depth at which the tests were conducted. If infiltration is to occur at different locations or depths, different rates may exist and further testing will be necessary. Individual counties and

municipalities may have stricter guidelines and applicable correction factors for infiltration rates and, if applicable, should be utilized for design. Rates will vary depending on head applied. For calculating “time to empty”, the design infiltration rates above should be reduced by half.

The Technical Guidance Document requires that testing be performed at several locations within the proposed drainage area depending on the quantity of design flow anticipated and the size of the BMP. For slow flow areas, tests are required to be performed over several days. The limited testing performed for this investigation should be repeated several times over several days at the proposed BMP location to adequately characterize the site soils in question for infiltration purposes. Testing and design factors assumed above are subject to change and may not be representative of actual conditions anticipated for the development.

3 CONCLUSIONS AND RECOMMENDATIONS

The subject property is considered a suitable site for the proposed development from a geologic and soils engineering standpoint. We believe that development of the site will not cause adverse effects on adjacent properties. It is our opinion that the proposed facility can be constructed provided the recommendations stated in the report are followed. Test findings and statements of professional opinion do not constitute a guarantee or warranty, expressed or implied.

The following preliminary geotechnical design recommendations have been developed on the basis of the previously described project characteristics and subsurface conditions encountered. If there are any changes in these project criteria, PSI should be contacted to determine if modifications to the recommendations are warranted.

Based on the results of the fieldwork, laboratory evaluation, and engineering analyses, the site can be adapted for the proposed facility. Based on the observed site conditions PSI believes that conventional spread footings are suitable to support the proposed structure. Details related to site preparation, foundation design, and construction are presented in the following sections.

3.1 EARTHQUAKE AND SEISMIC DESIGN CONSIDERATION

We have employed the 2016 California Building Code (CBC), the locally adopted version of the International Building Code, 2015 edition. As part of this code, the design of structures must consider dynamic forces resulting from seismic events. These forces are dependent upon the magnitude of the earthquake event as well as the properties of the soils that underlie the site.

As part of the procedure to evaluate seismic forces, the code requires the evaluation of the Seismic Site Class, which categorizes the site based upon the characteristics of the subsurface profile within the upper 100 feet of the ground surface. PSI's deepest boring extended to 51 ½ feet bgs, but to define the Site Class for this project, we have interpreted the results of soil test borings drilled within the project site and estimated appropriate soil properties below the base of the borings to a depth of 100 feet as permitted by the code. The estimated soil properties were based upon data available in published geologic reports as well as our experience with subsurface conditions in the general site area.

Based upon our evaluation, the subsurface conditions within the site are consistent with the characteristics of a **Site Class "D"** as defined in Chapter 20.3-1 of the ASCE 7-10. The associated probabilistic ground acceleration values and site coefficients for the general site area were

obtained from the USGS geohazards web page, <http://earthquake.usgs.gov/designmaps/us/application.php>, and are presented in the table below.

Table 4 - Ground Motion Values*

Period (sec)	Mapped MCE Spectral Response Acceleration** (g)		Site Coefficients		Adjusted MCE Spectral Response Acceleration (g)		Design Spectral Response Acceleration (g)	
0.2	S_s	2.018	F_a	1.0	S_{Ms}	2.018	S_{Ds}	1.345
1.0	S_1	0.741	F_v	1.5	S_{M1}	1.111	S_{D1}	0.741

*2% Probability of Exceedance in 50 years

MCE = Maximum Considered Earthquake

The Site Coefficients, F_a and F_v presented in the above table were also obtained from the noted USGS webpage as a function of the site classification and mapped spectral response acceleration at the short (S_s) and 1-second (S_1) periods, but can also be interpolated from ASCE Tables 11.4-1 and 11.4-2.

Considering the use of the proposed structures and the values of S_{Ds} and S_{D1} shown above, we expect the structures to fall within **Seismic Design Category D**, as defined by ASCE Tables 11.6-1 and 11.6-2 of the code. Design of structures should comply with the requirements of the governing jurisdiction's building codes and standard practices of the Structural Engineering Association of California.

3.2 SITE PREPARATION & GRADING

The following recommendations are provided for general grading of the site. More detailed geotechnical investigations may be required depending on the proposed development.

3.2.1 SITE PREPARATION

The site should be cleared of all man-made structures, surface vegetation, utilities, and construction debris. Any previous utilities, foundations, seepage pits, or other site improvements found on site in conflict with the new construction should be removed or abandoned in place

below the proposed structures. As a minimum, it is recommended the clearing operations extend at least five feet beyond the building and a few feet beyond the development perimeters.

We recommend that at the time of initial site stripping and grading, that PSI be retained to observe proof-rolling of excavations and subgrade conditions to verify that no potentially deleterious soft soils or unforeseen conditions are present. All excavation bottoms should be firm and unyielding prior to fill being placed above.

Though PSI was not provided with project-specific grading plans, proposed cuts and fills are anticipated within the project site to establish design grades. Any new fill should be placed in accordance with the Engineered Fill section of this report.

If grading occurs in the winter rainy season, unstable subgrade conditions may be present. These conditions may require stabilizing the subgrade with by adding coarse aggregate or admixtures such as cement kiln dust. Isolated areas may be stabilized using a geogrid, such as Tensar TX160 or equal, with one foot compacted Class II aggregate base over the geogrid. Additional recommendations can be provided, as required, during construction.

Asphalt and concrete debris will likely be generated from demolition at the site during construction. These materials may require hauling offsite or may be crushed for placement onsite per geotechnical recommendations or local building authorities.

3.2.2 REMEDIAL GRADING

All undocumented fill materials, within the limits of proposed structures, should be removed and replaced as evaluated by the Geotechnical Engineer or their representative. Existing unsuitable fill soils extending to a depth of 2½ feet bgs near boring location B1 and B2 should be removed and replaced with compacted engineered fill. Areas near boring locations B1, B3, and B4 should be evaluated closely as some soils appear to possibly consist of fill materials to depths of roughly 5 to 7 feet bgs. Loose or soft soils should also be removed and replaced near boring location B1 to a depth of roughly 9 feet bgs. The soils exposed at the base of all excavations should also be scarified to a depth of at least 12 inches, be compacted as described below in Section 3.2.3.

Dependent upon the building locations and their structural loads, some over-excavation of the existing soil and replacement as a properly compacted engineered fill beneath footings may be necessary to limit static settlements to acceptable levels. The need for this over-excavation

should be determined at the time of more detailed investigations and based on specific structural loading information to be provided.

Site grades may then be raised with Engineered Fill to achieve the design elevations proposed for the site. A PSI representative should be on-site during site grading to evaluate the degree of compaction obtained by the contractor.

3.2.3 ENGINEERED FILL

Engineered Fill materials required at this site, including both native and import soil, should not contain rocks greater than 3-inches in diameter or have greater than 30 percent retained on the $\frac{3}{4}$ -inch sieve, and should not contain more than 3 percent (by weight) of organic matter or other unsuitable material. Engineered Fill soils should also have an Expansion Index (EI) that does not exceed 40. Based on our subsurface investigation, existing on-site soils are generally suitable for use as Engineered Fill provided they can be properly moisture conditioned to meet the compaction requirement. This should be confirmed by a PSI representative during grading. Import materials meeting the above requirements should be approved by the Geotechnical Engineer prior to importing to the site. Soil that are environmentally impacted should not be used as Engineered Fill onsite.

Engineered Fill should be compacted to at least 90 percent of the maximum dry density as determined by the modified Proctor (ASTM D1557). The moisture content of Engineered Fill should be maintained between 0 to 2 percent above the material's optimum moisture content during compaction. If the Engineered Fill is too dry, water should be uniformly applied across the affected fill area. If the Engineered Fill is too wet, it must be dried. Engineered Fill should be thoroughly mixed by diskings, or other approved methods, to obtain relatively uniform moisture content throughout the lift immediately prior to compaction.

Engineered Fill should be placed in maximum lifts of 8-inches of loose material. Each lift of Engineered Fill should be tested by a PSI soils technician, working under the direction of our Project Geotechnical Engineer, prior to placement of subsequent lifts. If smaller compaction equipment such as jumping jacks or plate compactors are used thinner lifts may be required to achieve compaction.

Compaction of the backfill should be checked with a sufficient number of density tests by a representative of the Geotechnical Engineer to determine if adequate compaction is being

achieved by the contractor. The properly compacted Engineered Fill should extend horizontally outward beyond the exterior perimeter of the building and foundations a distance equal to the height of fill or 5-feet, whichever is greater, prior to significant sloping. In addition, Engineered Fill should extend horizontally outward beyond the exterior perimeter of pavements and hardscape a distance equal to the height of fill or 3-feet, whichever is greater, prior to significant sloping.

3.3 UTILITY TRENCH CONSTRUCTION

Utility trenches can be backfilled with on-site soils above the utility bedding and shading materials. Trench backfill should be moisture conditioned to between 0 to 2 percent above the optimum moisture content, compacted in 4- to 6-inch lifts to a minimum of 90 percent of the maximum dry density as determined by the modified Proctor (ASTM D1557). If rocks larger than 3-inches in maximum size are encountered, they should be removed from the fill material prior to placement in the utility trenches. Utility bedding and shading compaction requirements should be in conformance with the requirements of the local agencies having jurisdiction, but typically require clean granular material having a sand equivalent equal to or above 30. Jetting or flooding of utility backfill is not recommended.

3.4 SOIL EXPANSION

The expansion potential of representative samples of the existing site soils is low (EI=34 & 35). Such soils must be kept at a constant moisture content to avoid shrinkage and swelling near improvements. Foundation and slab subgrades must be designed for such soils. Landscaping, irrigation, and site grading/drainage must also be designed for such soils as mentioned below. Following site grading, testing of site soils should be performed by the project geotechnical consultant to confirm the basis of these recommendations. Depending upon the distribution of soil types and expansion characteristics, differing design recommendations may be developed to better suit the types of conditions present at the site.

3.5 CORROSION

Testing was performed to evaluate the corrosivity of the on-site soils and the potential for attack on concrete and subsurface cast iron and ductile iron utility pipes. The testing included pH, sulfate, chloride and minimum electrical resistivity. The results of the chemical analysis are as follows:

Table 3 – Corrosion Analyses

Boring Number	Sample Depth (feet)	pH	Minimum Resistivity (Ω -cm)	Soluble Sulfate (ppm)	Soluble Chlorides (ppm)
B3	1½ - 5	7.5	1100	246	145
B6	1 - 5	7.4	1050	576	230

Notes: ppm = parts per million.

Concrete mix design should follow the minimum requirements of the 2016 California Building Code and ACI 318. Laboratory testing of representative near surface soil samples indicates that the on-site soils have very low levels of sulfates such that they are characterized as having a **negligible** corrosion potential with respect to concrete based on ACI 318. Chloride levels also suggest that the site soils are **non-corrosive** to steel (iron/ferrous materials) according to Caltrans specifications. For preliminary design purposes, it is our opinion that the use of Type II cement is suitable for concrete in contact with on-site soils. Final concrete mix design should be evaluated after sulfate and chloride tests have been performed on the actual in-place subgrade material used for finished pad grades.

Based on the minimum resistivity laboratory test results, the soils are characterized as being **highly corrosive** to cast iron or ductile iron piping (National Association of Corrosion Engineers, 1984). PSI does not practice in the field of corrosion engineering. We suggest that a qualified corrosion engineer be consulted to determine if special corrosion protection is warranted. Testing for corrosivity of fill soils should be conducted after site grading.

3.6 SHALLOW FOUNDATIONS

Once proposed structural loadings and foundation plans are available, the geotechnical engineer should evaluate those plans for allowable foundation capacities which depend on the locations of the structures. On a preliminary basis, we would anticipate an allowable soil bearing pressure in the range of 3,000 to 5,000 psf, dependent upon the remedial grading performed. It is our opinion that the proposed buildings having relatively light loadings (150 to 250 kips) can be supported on conventional shallow spread footings bearing on Engineered Fill and/or stiff, or better, native soils, compacted to a firm and unyielding state. More heavily loaded foundations (>250 kips) may require deeper foundations or a ground improvement program to be more effective and to limit settlements to a tolerable level. Structures placed near boring location B3

should consider potential settlement issues. The size of the foundations, the bearing pressure and the embedment depth have a direct impact on the anticipated settlement. Once specific plans are developed and once detailed structural loading information is known, additional test borings and engineering analysis will be necessary.

3.7 SLABS ON GRADE

We anticipate that the proposed buildings may use slab-on-grade construction supported on Engineered Fill and/or suitable existing soil provided the subgrade has been prepared as described in Section 3.2 of this report. Soft or otherwise unsuitable areas observed should be addressed on a case-by-case basis by our Geotechnical Engineer.

Due to the presence of low expansive soils, we recommend that the subgrade soils beneath the building floor slab be moisture conditioned to 0 to 2 percent above the soil's optimum moisture content to a depth of at least 12 inches. This moisture conditioning is recommended to be verified by the geotechnical engineer within 48 hours of floor slab concrete placement. Floor slabs should have a nominal thickness of 5 inches and be reinforced with at least No. 3 bars placed at 18-inches centers each way. Additional steel reinforcement may be required for structural considerations.

To reduce moisture vapor transmission into interior spaces, we recommend a 10-mil vapor retarding membrane be included beneath slabs. Membrane specifications should be provided by the flooring manufacturer. Vapor retarders should be installed in accordance with ACI 302.1R and should extend to footings with no breaks (sealed between footings and around penetrations). A minimum 2 inch thick capillary break material (clean sand) should be provided above and below the vapor retarder to help protect the vapor barrier from punctures and to allow more uniform curing of the concrete slab.

This vapor retarder system is anticipated to be suitable for most flooring finishes that can accommodate some vapor emissions. However, this system may emit more than 3 pounds of water per 1000 square feet and therefore, may not be suitable for all flooring finishes. Additional steps should be taken if such vapor emission levels are too high for anticipated flooring finishes.

Exterior slabs should be isolated from the building. These slabs should be reinforced to function as independent units. Movement of these slabs should not be transmitted to the building

foundation or superstructure. We also recommend that expansive subgrade soils beneath concrete flatwork be moisture treated similar to that recommended for on-grade floor slabs.

The precautions listed below should be followed closely for construction of all slabs-on-grade. These details will not reduce the amount of movement, but are intended to reduce potential damage should some settlement of the supporting subgrade take place.

- Cracking of slabs-on-grade is normal and should be expected. Cracking can occur not only because of heaving or compression of the supporting soil, but also because of concrete curing stresses. The occurrence of concrete shrinkage cracks, and problems associated with concrete curing may be reduced and/or controlled by limiting the water/cement ratio of the concrete, proper concrete placement, finishing, and curing, and by the placement of crack control joints at frequent intervals, particularly, where re-entrant slab corners occur. The American Concrete Institute (ACI) recommends a maximum panel size (in feet) equal to approximately three times the thickness of the slab (in inches) in both directions. For example, joints are recommended at a maximum spacing of 12 feet, assuming a four-inch thick slab. We recommend also that control joints be scored three feet in from, and parallel to, the foundation walls. Using fiber reinforcement in the concrete can also help control shrinkage cracking.
- Some increase in moisture content is inevitable because of development and associated landscaping. However, extreme moisture content increases can be largely controlled by proper and responsible site drainage, building maintenance and irrigation practices. Landscaping and irrigation should be minimized immediately adjacent to buildings.

3.8 SETTLEMENT

Proposed loadings and structural foundation plans should be reviewed by the geotechnical engineer to accurately estimate settlements. Foundations (column loads <250 kips) designed and constructed in accordance with typical geotechnical recommendations are estimated to experience post-construction total settlements generally less than about 1-inch with differential settlement along a 40-foot long portion of a continuous footing, or similarly spaced column footings generally less than ½-inch. Total and differential settlements of these magnitudes are usually considered tolerable for the anticipated construction. However, the tolerance of proposed structures to predicted total and differential settlements should be confirmed by the structural engineer.

As previously noted, a seismic-induced settlement of about 0.7 inch with a corresponding differential seismic settlement of less than ½ inch over a 40 foot span is possible. Although these seismic settlements are well within levels considered tolerable (per SP 117A), we recommend that the structural engineer consider the seismic settlements in their design.

3.9 RETAINING WALLS

Standard retaining walls may be designed simply for walls up to a maximum height of six feet. Retaining walls above a height of six feet will require seismic loadings incorporated. Such walls may rely on shallow foundation recommendations to be provided.

Onsite clay soils are not considered suitable for retaining wall backfill. Clean granular soil backfill should be used from the site or imported. The backfill material should be compacted to at least 90 percent of the maximum dry density as determined by ASTM D1557 with optimum moistures within 0 to 2 percent above optimum. Compaction may be checked by probing if needed. Flooding or jetting of the backfill should not be permitted. Granular backfill should be capped with 12-inches of relatively impervious fill (clayey soils, concrete, CDF) or pavements to seal the backfill and reduce the potential for infiltration and saturation. It should be noted that the use of heavy compaction equipment in close proximity to retaining structures could result in wall pressures exceeding design values and causing wall movement. In this regard, the contractor should take appropriate precautions during the backfill placement and use relatively light compaction equipment.

For drained conditions, a back-drainage system should be installed to drain any water that may collect behind retaining walls. The drainage system should consist of a 1 cubic foot per foot burrito drain containing free-draining crushed rock (5%<#200) placed adjacent to the wall. The gravel should be completely enclosed in an approved filter fabric (Mirafi 140N, or equivalent) to separate the gravel and backfill soil. A 4-inch diameter perforated SCH-40 PVC pipe should be placed with perforations down, behind the bottom of the retaining wall at a gradient of at least one percent. Drainage outlets should be 4-inch diameter solid SCH-40 PVC pipe, installed to drain to an appropriate outlet. Drainage should be conducted away from structural foundations. Weep holes may be used if desired. The project geotechnical engineer should approve any alternative drain system.

Waterproofing the back of the retaining walls should be considered to mitigate water staining, infiltration, and moisture migration through the wall. If a waterproofing system is used, it should be designed by a qualified waterproofing consultant.

3.10 PAVEMENT DESIGN

In designing the proposed pavement areas, the following conditions were considered:

1. Subgrade support characteristics are typically represented by an R-Value for the design of flexible pavements in this region.
2. Vehicular traffic volumes, in terms of the number and frequency of vehicles and their range of axle loads should be considered.
3. Likely changes in vehicular use over the life of the pavement should also be considered. We have assumed that the pavement areas will not experience additional traffic.
4. Pavement life cycle was considered to be 20 years.

All site preparations and grading should be performed as discussed above in Section 3.2.

Since an evaluation of the characteristics of the actual soils present at pavement subgrade can only be provided at the completion of grading, the following pavement sections should be used for planning purposes only. Final pavement designs should be evaluated after R-value tests have been performed on the actual in-place subgrade materials exposed for use during construction.

It should be noted that additional earthwork and/or ground improvement efforts may be required during grading on the actual subgrade material encountered, in order to achieve the aforementioned design parameters and assumptions. These design thicknesses assume that a properly prepared subgrade has been achieved.

Based on the results of our field exploration and laboratory testing of sandy clay (worse case scenario), we recommend the pavement designs presented in the table below. The pavement design criteria are based on the soil conditions present at the site, an R-value of 6 and the Traffic Index indicated below based on the estimated traffic for the site. In more granular areas of the site, a thinner pavement section may be used if desired and designed.

Table 4 - Pavement Section Recommendations

Location	Traffic Index (TI)	Asphalt Thickness (inches)	+	Aggregate Base Thickness (inches)	Portland Cement Concrete Thickness (inches)	+	Aggregate Base Thickness (inches)
Standard Drive Aisles	5	3½	+	8½	5½	+	4
		4	+	7½			
Truck Drive Aisles	7	6	+	12	6	+	6
		7	+	10			

We recommend rigid pavements (Portland Cement Concrete, PCC) be constructed at all areas requiring heavy braking and turning such as intersections, entrances, docking bays, trash truck loading areas, etc. PCC pavement sections should incorporate appropriate steel reinforcement and crack control joints as designed by the project structural engineer. We recommend that sections be as nearly squared as possible and no more than 15-feet on a side. Score joints may be constructed by saw cutting to a depth of ¼ of the slab thickness. Expansion/cold joints may be used in lieu of score joints. Such joints should be properly sealed. A minimum 4,000 psi mix is recommended.

Prior to placement of aggregate base, subgrade soils should be proof-rolled and scarified to a depth of 12 inches, brought to moisture contents between 0 to 2 percent above optimum, then compacted to at least 95 percent of the laboratory standard. The laboratory standard should be ASTM D1557.

Aggregate base below pavement sections should be compacted to at least 95 percent of ASTM D1557 with moisture contents within +/-2 percent of optimum. Aggregate base materials should be Caltrans Class II Base.

All materials should conform to and be placed in accordance with the latest revision of the Standard Specifications for Public Works Construction (Greenbook), the American Concrete Institute (ACI), and the Portland Cement Association (PCA).

3.11 LANDSCAPING AND IRRIGATION

Landscaping and irrigation should be positioned away from the building by at least 5 feet. Trees and shrubs should be positioned a distance away from the building equal to half of their mature height. Hardscape should closely surround the building as much as possible. Moisture conditions within the soil should be maintained at a constant level to avoid wetting or drying and associated movements. If landscaping is desired closer to the building, moisture barriers may be added to limit moisture infiltration beneath the building.

3.12 CONSTRUCTION CONSIDERATIONS

The site soils are sensitive to disturbances caused by construction traffic and to changes in moisture content. During wet weather periods, increases in the moisture content of the soil can cause significant reduction in the soil strength and support capabilities. Furthermore, perched groundwater conditions can develop during periods of heavy rainfall as a result of less permeable layers impeding infiltration. In these instances, overlying subgrade soils may become unstable and require remedial measures. It will, therefore, be advantageous to perform earthwork and foundation construction activities during dry weather.

Groundwater was not encountered near the ground surface during our explorations onsite. It should be noted, however, that variations in the groundwater table may result from fluctuation in the ground surface topography, subsurface stratification, precipitation, irrigation, and other factors that may not have evident at the time of our exploration. This sometimes occurs where relatively impermeable and/or cemented materials are overlain by fill soils. We recommend that a representative of PSI be present during grading operations to evaluate areas of seepage. Drainage devices for reduction of water accumulation can be recommended if these conditions occur.

Water should not be allowed to collect in the foundation excavation, on floor slab areas, or on prepared subgrades of the construction area either during or after construction. Undercut or excavated areas should be sloped toward one corner to facilitate removal of any collected rainwater, groundwater, or surface runoff. Positive site drainage should be provided to reduce infiltration of surface water around the perimeter of the building and beneath the floor slabs during construction.

Final grading should be designed to provide positive drainage away from proposed structures. Soil areas within 10-feet of proposed structures should sloped at a minimum of 5 percent away from the structure, if possible. Roof leaders and downspouts should discharge onto paved surfaces sloping away from the structure or into a closed pipe system which outfalls to the street gutter or directly to the storm drain system.

4 REPORT LIMITATIONS

The proposed professional services have been performed, findings obtained, and preliminary recommendations prepared in accordance with generally accepted geotechnical engineering principles and practices at the time of this report. PSI is not responsible for the conclusions, opinions, or recommendations made by others based on this data. No other warranties are implied or expressed. **Simon**, its subsidiaries and affiliates can rely upon the report under the same terms as if it was originally prepared for them.

The scope of exploration was intended to evaluate soil conditions within the influence of the proposed development. The analyses and recommendations submitted in this report are based upon the data obtained from the soil borings performed at the locations indicated. If any subsoil variations become evident during the course of this project, a re-evaluation of the recommendations contained in this report will be necessary after we have had an opportunity to observe the characteristics of the conditions encountered. The applicability of the report should also be reviewed in the event significant changes occur in the design, nature, or location of the proposed structural.

This report is considered preliminary based on limited knowledge of the proposed development. The preliminary recommendations provided herein are only intended for feasibility evaluations and conceptual designs and should not be relied upon for final design recommendations. Future design concepts and plans will require further focused geotechnical investigations to determine final design and construction recommendations for specific development structures.

APPENDIX A

BORING LOGS

GENERAL NOTES

SAMPLE IDENTIFICATION

The Unified Soil Classification System (USCS), AASHTO 1988 and ASTM designations D2487 and D-2488 are used to identify the encountered materials unless otherwise noted. Coarse-grained soils are defined as having more than 50% of their dry weight retained on a #200 sieve (0.075mm); they are described as: boulders, cobbles, gravel or sand. Fine-grained soils have less than 50% of their dry weight retained on a #200 sieve; they are defined as silts or clay depending on their Atterberg Limit attributes. Major constituents may be added as modifiers and minor constituents may be added according to the relative proportions based on grain size.

DRILLING AND SAMPLING SYMBOLS

SFA: Solid Flight Auger - typically 4" diameter flights, except where noted.	☒ SS: Split-Spoon - 1 3/8" I.D., 2" O.D., except where noted.
HSA: Hollow Stem Auger - typically 3 1/4" or 4 1/4" I.D. openings, except where noted.	■ ST: Shelby Tube - 3" O.D., except where noted.
M.R.: Mud Rotary - Uses a rotary head with Bentonite or Polymer Slurry	▮ RC: Rock Core
R.C.: Diamond Bit Core Sampler	↓ TC: Texas Cone
H.A.: Hand Auger	☞ BS: Bulk Sample
P.A.: Power Auger - Handheld motorized auger	☒ PM: Pressuremeter
	CPT-U: Cone Penetrometer Testing with Pore-Pressure Readings

SOIL PROPERTY SYMBOLS

N: Standard "N" penetration: Blows per foot of a 140 pound hammer falling 30 inches on a 2-inch O.D. Split-Spoon.
N ₆₀ : A "N" penetration value corrected to an equivalent 60% hammer energy transfer efficiency (ETR)
Q _u : Unconfined compressive strength, TSF
Q _p : Pocket penetrometer value, unconfined compressive strength, TSF
w%: Moisture/water content, %
LL: Liquid Limit, %
PL: Plastic Limit, %
PI: Plasticity Index = (LL-PL), %
DD: Dry unit weight, pcf
▼, ▼, ▼ Apparent groundwater level at time noted

RELATIVE DENSITY OF COARSE-GRAINED SOILS ANGULARITY OF COARSE-GRAINED PARTICLES

<u>Relative Density</u>	<u>N - Blows/foot</u>
Very Loose	0 - 4
Loose	4 - 10
Medium Dense	10 - 30
Dense	30 - 50
Very Dense	50 - 80
Extremely Dense	80+

<u>Description</u>	<u>Criteria</u>
Angular:	Particles have sharp edges and relatively plane sides with unpolished surfaces
Subangular:	Particles are similar to angular description, but have rounded edges
Subrounded:	Particles have nearly plane sides, but have well-rounded corners and edges
Rounded:	Particles have smoothly curved sides and no edges

GRAIN-SIZE TERMINOLOGY

<u>Component</u>	<u>Size Range</u>
Boulders:	Over 300 mm (>12 in.)
Cobbles:	75 mm to 300 mm (3 in. to 12 in.)
Coarse-Grained Gravel:	19 mm to 75 mm (3/4 in. to 3 in.)
Fine-Grained Gravel:	4.75 mm to 19 mm (No.4 to 3/4 in.)
Coarse-Grained Sand:	2 mm to 4.75 mm (No.10 to No.4)
Medium-Grained Sand:	0.42 mm to 2 mm (No.40 to No.10)
Fine-Grained Sand:	0.075 mm to 0.42 mm (No. 200 to No.40)
Silt:	0.005 mm to 0.075 mm
Clay:	<0.005 mm

PARTICLE SHAPE

<u>Description</u>	<u>Criteria</u>
Flat:	Particles with width/thickness ratio > 3
Elongated:	Particles with length/width ratio > 3
Flat & Elongated:	Particles meet criteria for both flat and elongated

RELATIVE PROPORTIONS OF FINES

<u>Descriptive Term</u>	<u>% Dry Weight</u>
Trace:	< 5%
With:	5% to 12%
Modifier:	>12%

GENERAL NOTES

(Continued)

CONSISTENCY OF FINE-GRAINED SOILS

<u>Q_u - TSF</u>	<u>N - Blows/foot</u>	<u>Consistency</u>
0 - 0.25	0 - 2	Very Soft
0.25 - 0.50	2 - 4	Soft
0.50 - 1.00	4 - 8	Firm (Medium Stiff)
1.00 - 2.00	8 - 15	Stiff
2.00 - 4.00	15 - 30	Very Stiff
4.00 - 8.00	30 - 50	Hard
8.00+	50+	Very Hard

MOISTURE CONDITION DESCRIPTION

<u>Description</u>	<u>Criteria</u>
Dry:	Absence of moisture, dusty, dry to the touch
Moist:	Damp but no visible water
Wet:	Visible free water, usually soil is below water table

RELATIVE PROPORTIONS OF SAND AND GRAVEL

<u>Descriptive Term</u>	<u>% Dry Weight</u>
Trace:	< 15%
With:	15% to 30%
Modifier:	>30%

STRUCTURE DESCRIPTION

<u>Description</u>	<u>Criteria</u>	<u>Description</u>	<u>Criteria</u>
Stratified:	Alternating layers of varying material or color with layers at least ¼-inch (6 mm) thick	Blocky:	Cohesive soil that can be broken down into small angular lumps which resist further breakdown
Laminated:	Alternating layers of varying material or color with layers less than ¼-inch (6 mm) thick	Lensed:	Inclusion of small pockets of different soils
Fissured:	Breaks along definite planes of fracture with little resistance to fracturing	Layer:	Inclusion greater than 3 inches thick (75 mm)
Slickensided:	Fracture planes appear polished or glossy, sometimes striated	Seam:	Inclusion 1/8-inch to 3 inches (3 to 75 mm) thick extending through the sample
		Parting:	Inclusion less than 1/8-inch (3 mm) thick

SCALE OF RELATIVE ROCK HARDNESS

<u>Q_u - TSF</u>	<u>Consistency</u>
2.5 - 10	Extremely Soft
10 - 50	Very Soft
50 - 250	Soft
250 - 525	Medium Hard
525 - 1,050	Moderately Hard
1,050 - 2,600	Hard
>2,600	Very Hard

ROCK BEDDING THICKNESSES

<u>Description</u>	<u>Criteria</u>
Very Thick Bedded	Greater than 3-foot (>1.0 m)
Thick Bedded	1-foot to 3-foot (0.3 m to 1.0 m)
Medium Bedded	4-inch to 1-foot (0.1 m to 0.3 m)
Thin Bedded	1¼-inch to 4-inch (30 mm to 100 mm)
Very Thin Bedded	½-inch to 1¼-inch (10 mm to 30 mm)
Thickly Laminated	1/8-inch to ½-inch (3 mm to 10 mm)
Thinly Laminated	1/8-inch or less "paper thin" (<3 mm)

ROCK VOIDS

<u>Voids</u>	<u>Void Diameter</u>
Pit	<6 mm (<0.25 in)
Vug	6 mm to 50 mm (0.25 in to 2 in)
Cavity	50 mm to 600 mm (2 in to 24 in)
Cave	>600 mm (>24 in)

GRAIN-SIZED TERMINOLOGY

<u>(Typically Sedimentary Rock)</u>	
<u>Component</u>	<u>Size Range</u>
Very Coarse Grained	>4.76 mm
Coarse Grained	2.0 mm - 4.76 mm
Medium Grained	0.42 mm - 2.0 mm
Fine Grained	0.075 mm - 0.42 mm
Very Fine Grained	<0.075 mm

ROCK QUALITY DESCRIPTION

<u>Rock Mass Description</u>	<u>RQD Value</u>
Excellent	90 - 100
Good	75 - 90
Fair	50 - 75
Poor	25 - 50
Very Poor	Less than 25

DEGREE OF WEATHERING

Slightly Weathered:	Rock generally fresh, joints stained and discoloration extends into rock up to 25 mm (1 in), open joints may contain clay, core rings under hammer impact.
Weathered:	Rock mass is decomposed 50% or less, significant portions of the rock show discoloration and weathering effects, cores cannot be broken by hand or scraped by knife.
Highly Weathered:	Rock mass is more than 50% decomposed, complete discoloration of rock fabric, core may be extremely broken and gives clunk sound when struck by hammer, may be shaved with a knife.

SOIL CLASSIFICATION CHART

NOTE: DUAL SYMBOLS ARE USED TO INDICATE BORDERLINE SOIL CLASSIFICATIONS

MAJOR DIVISIONS			SYMBOLS		TYPICAL DESCRIPTIONS
			GRAPH	LETTER	
COARSE GRAINED SOILS MORE THAN 50% OF MATERIAL IS LARGER THAN NO. 200 SIEVE SIZE	GRAVEL AND GRAVELLY SOILS MORE THAN 50% OF COARSE FRACTION RETAINED ON NO. 4 SIEVE	CLEAN GRAVELS (LITTLE OR NO FINES)		GW	WELL-GRADED GRAVELS, GRAVEL - SAND MIXTURES, LITTLE OR NO FINES

PERCOLATION TEST RESULTS

Boring Percolation Test Datasheet

Client: Simon

Test Date: 2/2/2018

Project: Brea Mall

Work Order No.: 00661261

Address: 100 Brea Mall

Technician: Lloyd Guss + Manny R.

Brea, CA

Weather: Sunny, Clear

Test Hole Number/Location: B3

Depth of Total Test Hole bottom below land surface (inches): 9.5 ft.

Test hole cross-section (check a box and indicate size):

☒ Diameter: 8 inches

☐ Square: _____ inches

The land surface at the top of the test hole is (check one):

☐ Undisturbed Native Soil

☐ Cut Surface

☐ Fill Surface

☒ Other (describe): Paved Parking Lot

Soil Data from Test Hole:

Depth (ft)	Soil Texture
0 - 4.75	Sandy Clay
4.75 - 7	Silty Sand
7 - 28	Silty Clay

Perforated PVC Pipe Diameter = 4"

Solid end cap on pipe.

Pipe Length = 10.25' (10'3")

Stick up above asphalt = 18"

Depth of water during testing =

35.16 inches

Average Head during testing =

35.1 inches

Test Hole Presoaking

Presoak >12in. = If drains away in 30 min. (x2), Test @10min. If not, Test @30min.

Attachment 4 – Infiltration Feasibility Screening

Table 2.7: Infiltration BMP Feasibility Worksheet

	Infeasibility Criteria	Yes	No
1	Would Infiltration BMPs pose significant risk for groundwater related concerns? Refer to Appendix VIII (Worksheet I) for guidance on groundwater-related infiltration feasibility criteria.		XX
Provide basis: Per Geotechnical Report Groundwater was encountered at at depth of 25-30 feet deep. Additionally, the project is not located within any groundwater basin protection area per TGD Maps provided in Attachment 3. Summarize findings of studies provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability.			
2	Would Infiltration BMPs pose significant risk of increasing risk of geotechnical hazards that cannot be mitigated to an acceptable level? (Yes if the answer to any of the following questions is yes, as established by a geotechnical expert): • The BMP can only be located less than 50 feet away from slopes steeper than 15 percent • The BMP can only be located less than eight feet from building foundations or an alternative setback. • A study prepared by a geotechnical professional or an available watershed study substantiates that stormwater infiltration would potentially result in significantly increased risks of geotechnical hazards that cannot be mitigated to an acceptable level.		XX
Provide basis: Per Geotechnical Report infiltration is feasible (provided that it is within area with suitable infiltration rate). Chambers not located within 50' of slopes or within 8' of foundation Summarize findings of studies provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability.			
3	Would infiltration of the DCV from drainage area violate downstream water rights?		XX
Provide basis: There are no downstream water rights restricting infiltration Summarize findings of studies provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability.			

Table 2.7: Infiltration BMP Feasibility Worksheet (continued)

	<i>Partial Infeasibility Criteria</i>	Yes	No
4	Is proposed infiltration facility located on HSG D soils or the site geotechnical investigation identifies presence of soil characteristics which support categorization as D soils?		XX
Provide basis: <i>There are areas onsite that are HSG D Soils. However, the BMPs are not located within those areas.</i> Summarize findings of studies provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability.			
5	Is measured infiltration rate below proposed facility less than 0.3 inches per hour? This calculation shall be based on the methods described in Appendix VII .		XX
Provide basis: <i>Measured infiltration rate is 2.8 in/hr in Chamber Area per Geotechnical Report</i> Summarize findings of studies provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability.			
6	Would reduction of over predeveloped conditions cause impairments to downstream beneficial uses, such as change of seasonality of ephemeral washes or increased discharge of contaminated groundwater to surface waters?		XX
Provide citation to applicable study and summarize findings relative to the amount of infiltration that is permissible: <i>There are no identified ephemeral washes or contaminated groundwater at the project site or discharge location.</i> Summarize findings of studies provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability.			
7	Would an increase in infiltration over predeveloped conditions cause impairments to downstream beneficial uses, such as change of seasonality of ephemeral washes or increased discharge of contaminated groundwater to surface waters?		XX
Provide citation to applicable study and summarize findings relative to the amount of infiltration that is permissible: <i>There are no identified ephemeral washes or contaminated groundwater at the project site or discharge location.</i> Summarize findings of studies provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability.			

Table 2.7: Infiltration BMP Feasibility Worksheet (continued)

Infiltration Screening Results (check box corresponding to result):		
8	Is there substantial evidence that infiltration from the project would result in a significant increase in I&I to the sanitary sewer that cannot be sufficiently mitigated? (See Appendix XVII) Provide narrative discussion and supporting evidence: No. There is no recorded I&I of the sanitary sewer system in the area. The Sanitary Sewer is not located near the proposed chamber systems. Summarize findings of studies provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability.	NO
9	If any answer from row 1-3 is yes: infiltration of any volume is not feasible within the DMA or equivalent. Provide basis: Answers 1-3 are all marked "NO". Summarize findings of infeasibility screening	
10	If any answer from row 4-7 is yes, infiltration is permissible but is not presumed to be feasible for the entire DCV. Criteria for designing biotreatment BMPs to achieve the maximum feasible infiltration and ET shall apply. Provide basis: Answers 4-7 are all marked "NO". Summarize findings of infeasibility screening	
11	If all answers to rows 1 through 11 are no, infiltration of the full DCV is potentially feasible, BMPs must be designed to infiltrate the full DCV to the maximum extent practicable.	Infiltration of Full DCV is Feasible

Harvest and Use Infeasibility

Harvest and use infeasibility criteria include:

- If inadequate demand exists for the use of the harvested rainwater. See [Appendix X](#) for guidance on determining harvested water demand and applicable feasibility thresholds.
- If the use of harvested water for the type of demand on the project violates codes or ordinances most applicable to stormwater harvesting in effect at the time of project application and a waiver of these codes and/or ordinances cannot be obtained. It is noted that codes and ordinances most applicable to stormwater harvesting may change

Worksheet H: Factor of Safety and Design Infiltration Rate and Worksheet

Factor Category		Factor Description	Assigned Weight (w)	Factor Value (v)	Product (p) p = w x v
A	Suitability Assessment	Soil assessment methods	0.25	1.0	0.25
		Predominant soil texture	0.25	1.0	0.25
		Site soil variability	0.25	1.0	0.25
		Depth to groundwater / impervious layer	0.25	1.0	0.25
		Suitability Assessment Safety Factor, S _A = Σp			
B	Design	Tributary area size	0.25	3.0	0.75
		Level of pretreatment/ expected sediment loads	0.25	2.0	0.5
		Redundancy	0.25	3.0	0.75
		Compaction during construction	0.25	2.0	0.5
		Design Safety Factor, S _B = Σp			
Combined Safety Factor, S _{Total} = S _A x S _B				2.5	
Observed Infiltration Rate, inch/hr, K _{observed} (corrected for test-specific bias)				2.8	
Design Infiltration Rate, in/hr, K _{DESIGN} = K _{Observed} / S _{Total}				1.12	
Supporting Data					
Briefly describe infiltration test and provide reference to test forms:					
In-situ percolation testing was performed in accordance with the Technical Guidance Document for the preparation of this WQMP. See Section 2.9 of Geotechnical Report in Attachment 2 of this WQMP.					

Note: The minimum combined adjustment factor shall not be less than 2.0 and the maximum combined adjustment factor shall not exceed 9.0.

Worksheet I: Summary of Groundwater-related Feasibility Criteria

1	Is project large or small? (as defined by Table VIII.2) circle one	Large	Small
2	What is the tributary area to the BMP?	A	17.80 acres
3	What type of BMP is proposed?	Infiltration Chambers	
4	What is the infiltrating surface area of the proposed BMP?	A _{BMP}	12,246 sq-ft
5	What land use activities are present in the tributary area (list all) Retail, Restaurant, Residential, Parking Lot and Open Space		
6	What land use-based risk category is applicable?	L	M H
7	If M or H, what pretreatment and source isolation BMPs have been considered and are proposed (describe all): Inlet Filters are proposed on the proposed storm drain inlets and trench drain inlet		
8	What minimum separation to mounded seasonally high groundwater applies to the proposed BMP? See Section VIII.2 (circle one)	5 ft	10 ft
9	Provide rationale for selection of applicable minimum separation to seasonally high mounded groundwater: Proposed BMPs are "Subsurface Infiltration Galleries or vaults". Per Section VIII.2 the depth to high groundwater is 10' minimum.		
10	What is separation from the infiltrating surface to seasonally high groundwater?	SHGWT	11-16 ft
11	What is separation from the infiltrating surface to mounded seasonally high groundwater?	Mounded SHGWT	11-16 ft
12	Describe assumptions and methods used for mounding analysis: Chamber Systems are approximately 14' deep to bottom of chamber. High groundwater is expected at 25-30' deep.		
13	Is the site within a plume protection boundary (See Figure	Y	N N/A

Worksheet I: Summary of Groundwater-related Feasibility Criteria

	VIII.2)?	
14	Is the site within a selenium source area or other natural plume area (See Figure VIII.2)?	Y N N/A
15	Is the site within 250 feet of a contaminated site?	Y N N/A
16	If site-specific study has been prepared, provide citation and briefly summarize relevant findings: No site-specific study has been prepared. Answers 13-15 based on available data	
17	Is the site within 100 feet of a water supply well, spring, septic system?	Y N N/A
18	Is infiltration feasible on the site relative to groundwater-related criteria?	Y N
Provide rationale for feasibility determination: Per the Geotechnical Report Groundwater is expected at 25-30 bgs. Site does not have any groundwater infiltration constraints based on the available maps in the TGD.		

Note: if a single criterion or group of criteria would render infiltration infeasible, it is not necessary to evaluate every question in this worksheet.

City of Brea

BMP Maintenance Self-Certification Form for the City of Brea

In addition to routine annual inspections conducted by the City for proper maintenance of post-construction stormwater control measures or Best Management Practices (BMPs) on the property, the City of Brea requires that the party responsible for maintenance of these BMPs receive proper orientation and training on their operations and maintenance. This form is to be completed by the owner representative and shall be made available to the City Authorized Inspector upon request. Should the maintenance provider or facility maintenance representative change at any time, the owner representative shall complete this form with the new responsible party for BMP maintenance.

Property Information	BMP O&M

As the party responsible for operation and maintenance of the BMPs specified in the approved Water Quality Management Plan (WQMP) for the subject property, I hereby certify under penalty of law that I, or persons under my supervision, are qualified and competent to carry out the inspection and maintenance the BMPs in a manner consistent with the approved WQMP Operation and Maintenance (O&M) Plan.

Maintenance Representative Signature

Date

As the owner representative of the Brea Mall Expansion of which a Water Quality Management Plan (WQMP) was approved by the City, I hereby certify under penalty of law that all BMPs contained within the approved Project WQMP have been maintained and inspected in accordance with the schedule and frequency outlined in the approved WQMP Operation and Maintenance (O&M) Plan. The maintenance activities and inspections conducted have been performed by qualified and knowledgeable individuals listed above. To the best of my knowledge, the information submitted is

true and accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fines and citations for violating water quality regulations.

Subject: **Preliminary Geotechnical Investigation**
Proposed Brea Mall Development
1066 Brea Mall
Brea, California 92821
PSI Project No. 00661261

Dear Mr. Poynter;

As requested, Professional Service Industries, Inc. (PSI), an Intertek Company, is pleased to provide this report summarizing our Preliminary Geotechnical Investigation for the above referenced project in Brea, California. This report includes the results of our review of published and unpublished geologic information, subsurface exploration, laboratory testing, and our preliminary conclusions and recommendations as they pertain to the proposed development of the property.

We appreciate the opportunity to perform this Preliminary Geotechnical Investigation and look forward to continued participation during the design and construction phases of this project. If you have any questions pertaining to this report, or if we may be of further service, please contact our office.

Respectfully submitted,

PROFESSIONAL SERVICE INDUSTRIES, INC.

Douglas T. Abernathy, PE, GE
Senior Project Engineer

Robert R. Russell, PE
Principal Consultant

1 PROJECT INFORMATION

1.1 PROJECT AUTHORIZATION

Professional Service Industries, Inc. (PSI) has completed a Preliminary Geotechnical Investigation for the proposed Brea Mall Development to be located in the southwest corner of the Brea Mall property in Brea, California. Our work was performed in general accordance with our proposal revised January 22, 2018 and signed February 2, 2018.

1.2 PROJECT DESCRIPTION

PSI understands that conceptually the site is proposed to be improved with several buildings ranging from 3,000 square feet (sf) to 120,000 sf along with a 5 to 6-Level parking garage holding 1,000 to 1,300 vehicles. Development of the site will also include paving, hardscape, landscaping, utilities, possibly a pool, and various other improvements. The existing Sears store is proposed to be demolished. Grading plans have not been developed but we assume grades will remain relatively level with minor adjustments of less than ± 2 feet as the site consists of an active mall and parking lots. The proposed developments may have maximum column loadings of roughly 150 to 200 kips for one-story, 200 to 250 kips for two-story, and 300 to 400 kips for three-story structures. The parking structure may induce loadings of 750 to 1,000 kips. Wall loadings are anticipated to be 3 to 15 kips/ft. Shallow foundations including slab-on-grade construction is anticipated. Slabs may support loadings of up to 150 pounds per square foot.

The preliminary geotechnical recommendations presented in this report are based on the available project information, site location, laboratory testing, and the subsurface materials encountered. If any of the noted information is incorrect, please inform PSI in writing so that we may amend the recommendations presented in this report if appropriate and if desired by the client. PSI will not be responsible for the implementation of its recommendations when it is not notified of changes to the project. We understand that future, more detailed plans and designs are proposed and therefore, more detailed geotechnical investigations will need to be performed for select buildings.

1.3 PURPOSE AND SCOPE OF SERVICES

The purpose of this preliminary geotechnical investigation was to explore the subsurface conditions and provide suitable preliminary design recommendations for the proposed developments. The investigation for this project involved drilling six geotechnical soil borings, perform percolation testing in two of the borings, laboratory testing, and geotechnical analyses. This report briefly outlines the testing procedures, presents available project information,

describes the site and subsurface conditions, and presents preliminary geotechnical recommendations for the following:

- Seismic hazards on the property;
- Site preparation and grading;
- General foundation types, depths, allowable bearing capacities, and estimates of settlement;
- Concrete floor slabs;
- Paving recommendations;
- Retaining wall recommendations;
- Percolation test results; and
- Comments regarding factors that may impact construction and performance of the proposed development.

This report is **not** intended to be used for final design purposes. Additional geotechnical investigations will be necessary based on future grading plans and foundation plans proposed for the development.

The scope of services did not include environmental assessments for determining the presence or absence of wetlands, or hazardous or toxic materials in the soil, surface water, groundwater, or air on or below, or around this site. Any statements in this report or on the boring logs regarding odors, colors, and unusual or suspicious items or conditions are strictly for informational purposes. PSI can perform Phase I/ESA, asbestos, lead, and mold surveys of the existing site improvements and property if desired with an additional budget.

2 SITE AND SUBSURFACE CONDITIONS

2.1 SITE LOCATION AND DESCRIPTION

The project site is situated at 1066 Brea Mall in Brea, California in the southwest corner of the mall property. The proposed development spans across an area of roughly 800-feet by 800-feet. The property is bounded to the west by Randolph Avenue, to the south by other commercial developments and Imperial Highway and State College Boulevard, to the east by parking areas, and to the north and east by the main mall development. At the time of our fieldwork, the site consisted of an existing two to three-story Sears store with surface parking areas, drive aisles, landscaping, hardscaping, and a roughly 15-foot high slope. The site appears to slope to the southwest with elevations (estimated from Google Earth) ranging from roughly 330 to 350 feet above mean sea level. The site is located at approximate latitude 33.9137° and longitude -117.8883°. A Site Vicinity Map showing the site location is included as Figure 1.

2.2 PREVIOUS INVESTIGATIONS

Previously Converse Consultants Orange County (Converse) performed several geotechnical investigations for the mall development as listed below:

Table 1 – Converse Consultants Reports

Year	Report
1974	Original geotechnical report for the mall development.
1974 – 1978	Grading reports for earthwork.
1975	Fill compaction reports.
1977	Fill compaction reports.
1978	Geotechnical investigation for Nordstrom.
1980	Geotechnical investigation for restaurant on perimeter access road on State College Boulevard.
1984	Geotechnical investigation for repaving perimeter road, south and east.
1985	Geotechnical investigation for hotel and parking structure on Bristol St.
1986	Geotechnical investigation for restaurant on perimeter access road on State College Boulevard.
1987	Geotechnical investigation for mall expansion to northwest and southeast.

The 1987 report describes encountering compacted fill and native terrace deposits. Soils encountered by Converse predominantly consisted of sandy clay beneath the site. Other soils were also encountered including silty sand, clayey sand, clay, silt, and sandy silt. The majority of the fill soils were encountered southwest of the Macy's store (5 to 33 feet bgs). Relatively moderate amounts of fill were encountered beneath the parking structure west of Nordstrom (0 to 13 feet bgs). Groundwater was described by Converse as being deeper than 50 feet bgs (Orange County Water District, 1976) with perched water encountered at depths ranging from 23½ to 42½ feet bgs. Existing pavements consisted of roughly 3 inches of asphalt concrete over 4 inches of aggregate base. Sulfate testing of the soils indicated 160 to 224 ppm. Expansion index testing (generally 40 to 50) indicated low to medium expansion potential. R-values ranged from 6 to 13 for sandy clay and clayey sand respectively.

2.3 REGIONAL GEOLOGY

The site is located within the La Habra 7½ minute quadrangle within the Los Angeles Basin Geomorphic Province boundary. Based on a review of the Dibblee Geologic Map of the area (2001), the site is underlain by elevated older alluvial deposits. Areas nearby (outside the proposed development area) to the southwest and southeast consist of younger alluvium that is considered potentially liquefiable.

2.4 REGIONAL SEISMICITY

The project site is located in Southern California, which has undergone a complex multiphase structural history and remains an active tectonic region with documented historic earthquakes. Generally, the seismicity within California can be attributed to faulting due to regional tectonic movement. This includes the San Andreas Fault and other sub-parallel strike-slip faults, as well as normal and thrust faulting within the State. The area of the subject site is considered seismically active. Seismic hazards within the area can be attributed to potential ground shaking resulting from earthquake events along nearby or more distant faulting.

2.5 SEISMIC HAZARD ASSESSMENT

2.5.1 Alquist-Priolo Fault Zone

The seismicity of the site was evaluated utilizing deterministic methods for active faults within the regional vicinity. According to the Alquist-Priolo Special Studies Zones Act of 1972 (revised

1994) faults have been classified as active faults which show apparent movement during the last 11,000 years (i.e., Holocene time). The site is not located within a currently designated Earthquake Fault Zone per the Alquist-Priolo Special Studies Zone Map produced by the California Geological Survey (CGS). Based on CGS mapping, the closest active fault is the Whittier Fault (Elsinore fault zone, Whittier section) located approximately 1.7 miles to the northeast from the site.

2.5.2 Liquefaction-Induced Settlement

The primary causes of damage in this general area during seismic events include ground shaking and liquefaction of the subsurface strata. Liquefaction occurs when loose granular and low plastic materials below the groundwater table are subjected to cyclic shear forces resulting from seismic events. Water pressure within the pore spaces of the soil increases with a corresponding decrease in the soil's effective stress and individual grains of soil lose contact with each other. Excess pore pressures ultimately dissipate and the soil consolidates, often causing significant total and differential settlement of the ground surface.

Liquefaction potential is greatest where the ground water level is shallow and submerged loose fine sands and silts and soft low plasticity clays occur within a depth of about 50 feet or less. Liquefaction potential decreases as grain size and clay and gravel content increase. As ground acceleration and shaking duration increase during an earthquake, liquefaction potential increases.

A review of the California Geologic Survey (CGS) map indicates that the site is not in an area designated as having a liquefaction potential. Areas of potentially liquefiable younger alluvium exist to the southwest and southeast offsite. Liquefaction analyses were performed onsite at one boring location due to high groundwater levels and questionable soil strengths. Our liquefaction analysis indicates that a zone of poorly graded sand between depths of 33 to 37 feet bgs may liquefy during the design earthquake with high groundwater levels. Seismic settlements induced from such liquefaction may result in 0.7-inch of displacement with an estimated differential settlement of less than ½ inch over a 40 foot span. Our liquefaction analysis is provided in Appendix D.

We do not believe lateral spreading or surficial disturbances will be an issue at this site due to potential liquefaction.

2.5.3 Landsliding

A review of the CGS map indicates that the site is not in an area designated as having a landslide potential. Due to the generally flat nature of the site and surrounding properties, it is our opinion that the site is not susceptible to landsliding.

2.5.4 Tsunamis and Seiches

Inundation by tsunamis (seismic or "tidal waves") are not likely to be considered a significant threat to the subject site due to the distance from the coast. The elevation of the project site is also significantly above sea level. Based on there being no bodies of water near the site, the site is also not considered subject to seiches.

2.6 SUBSURFACE CONDITIONS

2.6.1 GENERAL

The boring locations were marked in the field by a PSI representative by referencing existing landmarks based on the information provided by the client. A truck-mounted drill rig and continuous flight, hollow-stem augers were used to advance the soil borings.

During the sampling procedure, Standard Penetration Tests (SPT) were performed in accordance with ASTM D1586 and relatively undisturbed samples were obtained in general accordance with ASTM D3550. The SPT for soil borings is performed by driving a split-spoon sampler, with an outside diameter of 2 inches, into the undisturbed formation located at the bottom of the advanced borehole with repeated blows of a 140-pound hammer falling a vertical distance of 30 inches. The number of blows required to drive the sampler the last 12 inches of an 18-inch penetration depth is a measure of the soil consistency (N-value). If 50 blows are performed before reaching the end of a 6 inch increment this is referred to as refusal and the number of blow per inches driven is recorded, i.e. 50/4 inches. For ASTM D3550 (California Modified Sampler) the split barrel sampler possesses a 3-inch O.D. and is driven in the same manner as the SPT. The field blow counts obtained from the California Modified sampler, as indicated in the boring logs, were adjusted by 63 percent to obtain a rough correlation to SPT blow counts (SPT-N value). Samples were identified in the field, placed in sealed containers and transported to the laboratory for further classification and testing.

2.6.2 SOIL BORINGS

The subsurface conditions were explored by drilling six soil borings (B1 through B6) at the site for geotechnical exploration purposes. Two borings (B1 and B2) were drilled closer to the mall for correlations with previous borings performed by Converse Consultants in 1987. Two borings (B3 and B4) were drilled in the southwest region of the proposed development to depths of approximately 51½ feet below the ground surface (bgs) for purposes of liquefaction analysis. Percolation testing was also performed near these two borings (B3 and B4) to depths of 10 feet bgs. Two borings (B5 and B6) were drilled to depths of 31½ feet at mid-elevation portions of the site for general geotechnical analysis. Figure 2 shows the approximate boring locations. The soil types encountered at the specific boring locations are presented on the attached Boring Logs provided in Appendix A.

As indicated on the boring logs, the subsurface soils consisted of many types of soils ranging from sands to silts to clays and combinations of each. Coarse grained soils had relative densities ranging from loose to very dense while fine grained soils had consistencies ranging from soft to hard. Fill was encountered at boring locations B1 (2.3 feet bgs) and B2 (2½ feet bgs). Possible fill was encountered at boring locations B1 (2.3 to 4.7 feet bgs), B3 (1½ to 7 feet bgs), and B4 (0.8 to 5 feet bgs). Near surface loose and soft soils were encountered at boring locations B1 (1½ to 9 feet bgs) and B3 (4.7 to 7 feet bgs).

The stratification presented on the boring logs is based on a visual examination of the recovered soil samples and the interpretation of field logs by a geotechnical professional. Included on the boring logs are the standard penetration resistances (SPT N-values and California Modified sampler blows) recorded in the individual borings at standard testing intervals to the boring termination depths.

The above subsurface description is of a generalized nature to highlight the major subsurface stratification features and material characteristics. The boring logs, included in Appendix A, should be reviewed for specific information at individual boring locations. These records include soil descriptions, stratification, penetration resistance, locations of the samples and laboratory test data. The stratification shown on the boring logs represents the conditions only at the actual boring locations at the time of our exploration. Variations may occur and should be expected between boring locations. The stratification that represents the approximate boundary between subsurface materials and the actual transition may be gradual.

2.7 GROUNDWATER

Groundwater was encountered in two of our soil borings during our investigation at depths ranging from approximately 25 feet bgs (at boring location B4) to 30 feet bgs (at boring location B3). These depths are approximate as the drilling operations continued and monitoring equipment was not installed. Groundwater is not expected to impact the proposed construction. It is possible, however, that transient, saturated ground conditions at shallower depths could develop at a later time due to periods of heavy precipitation, landscape watering, leaking water lines, or other unforeseen causes. Variations in groundwater levels should be expected seasonally, annually, and from location to location.

2.8 LABORATORY TESTING

The soil samples obtained during the field exploration were transported to our laboratory and selected soil samples were tested in the laboratory to determine the material properties for evaluation. Laboratory testing on selected samples included moisture content (ASTM D2216), density (ASTM D2937), grain size distribution (ASTM D422), Atterberg Limits (ASTM D4318), expansion index (ASTM D4829), R-value (CTM 301), consolidation (ASTM D2435), direct shear (ASTM D3080), and corrosion testing [soluble sulfate (CTM 417), soluble chloride (CTM 422), pH (ASTM D4972), and minimum resistivity (CTM 643)]. Laboratory testing was performed in general accordance with ASTM and Caltrans procedures. Unless otherwise informed, the soil samples will be discarded 60 days from the issuance of this report. Laboratory test results are included in Appendix B.

2.9 PERCOLATION TESTING

A limited program of in-situ percolation testing was performed at two boring locations [B3(P1) and B4(P2)] as shown on Figure 2. Testing was performed in general accordance with the Technical Guidance Document for the Preparation of Conceptual/Preliminary and/or Project Water Quality Management Plans for the Santa Ana Regional Water Quality Control Board (September, 2013). Results of the testing are provided below in Table 1 and are attached in an Appendix C.

Table 2 – Percolation Test Results

Test Location	Raw Infiltration Rate (in/hr)	Design Infiltration Rate (in/hr)
P1 (B3)	0.0	0.0
P2 (B4)	2.8	1.4

Measured percolation rates were reduced to determine design values that will represent long-term performance of the proposed infiltration BMPs. The recommended factor values used were obtained from the Technical Guidance Document referenced above. We have assumed that maintenance of the designed system will be performed regularly. The following assumptions were made:

Table 3 – Percolation Assumptions

Factor Category	Factor Description	Factor Value Location P1/B3	Factor Value Location P2/B4
Suitability Assessment	Soil Assessment Methods	2	2
	Predominant Soil Texture	3	1
	Site Soil Variability	4	2
	Depth to Groundwater or Impervious Layer	1	1
Design	Tributary Area Size	1	1
	Level of Pretreatment	1	1
	Redundancy	1	1
	Compaction During Constr.	1	1
Combined FS	$\sum S_{Total}$	2	1.5
Measured Rate	(in/hr)	0.0	2.8
Design Rate	(in/hr)	0.0	1.4

Use a minimum FS of 2 for design

Please note that percolation/infiltration rates are representative of the location and depth at which the tests were conducted. If infiltration is to occur at different locations or depths, different rates may exist and further testing will be necessary. Individual counties and

municipalities may have stricter guidelines and applicable correction factors for infiltration rates and, if applicable, should be utilized for design. Rates will vary depending on head applied. For calculating “time to empty”, the design infiltration rates above should be reduced by half.

The Technical Guidance Document requires that testing be performed at several locations within the proposed drainage area depending on the quantity of design flow anticipated and the size of the BMP. For slow flow areas, tests are required to be performed over several days. The limited testing performed for this investigation should be repeated several times over several days at the proposed BMP location to adequately characterize the site soils in question for infiltration purposes. Testing and design factors assumed above are subject to change and may not be representative of actual conditions anticipated for the development.

3 CONCLUSIONS AND RECOMMENDATIONS

The subject property is considered a suitable site for the proposed development from a geologic and soils engineering standpoint. We believe that development of the site will not cause adverse effects on adjacent properties. It is our opinion that the proposed facility can be constructed provided the recommendations stated in the report are followed. Test findings and statements of professional opinion do not constitute a guarantee or warranty, expressed or implied.

The following preliminary geotechnical design recommendations have been developed on the basis of the previously described project characteristics and subsurface conditions encountered. If there are any changes in these project criteria, PSI should be contacted to determine if modifications to the recommendations are warranted.

Based on the results of the fieldwork, laboratory evaluation, and engineering analyses, the site can be adapted for the proposed facility. Based on the observed site conditions PSI believes that conventional spread footings are suitable to support the proposed structure. Details related to site preparation, foundation design, and construction are presented in the following sections.

3.1 EARTHQUAKE AND SEISMIC DESIGN CONSIDERATION

We have employed the 2016 California Building Code (CBC), the locally adopted version of the International Building Code, 2015 edition. As part of this code, the design of structures must consider dynamic forces resulting from seismic events. These forces are dependent upon the magnitude of the earthquake event as well as the properties of the soils that underlie the site.

As part of the procedure to evaluate seismic forces, the code requires the evaluation of the Seismic Site Class, which categorizes the site based upon the characteristics of the subsurface profile within the upper 100 feet of the ground surface. PSI's deepest boring extended to 51 ½ feet bgs, but to define the Site Class for this project, we have interpreted the results of soil test borings drilled within the project site and estimated appropriate soil properties below the base of the borings to a depth of 100 feet as permitted by the code. The estimated soil properties were based upon data available in published geologic reports as well as our experience with subsurface conditions in the general site area.

Based upon our evaluation, the subsurface conditions within the site are consistent with the characteristics of a **Site Class "D"** as defined in Chapter 20.3-1 of the ASCE 7-10. The associated probabilistic ground acceleration values and site coefficients for the general site area were

obtained from the USGS geohazards web page, <http://earthquake.usgs.gov/designmaps/us/application.php>, and are presented in the table below.

Table 4 - Ground Motion Values*

Period (sec)	Mapped MCE Spectral Response Acceleration** (g)		Site Coefficients		Adjusted MCE Spectral Response Acceleration (g)		Design Spectral Response Acceleration (g)	
0.2	S_s	2.018	F_a	1.0	S_{Ms}	2.018	S_{Ds}	1.345
1.0	S_1	0.741	F_v	1.5	S_{M1}	1.111	S_{D1}	0.741

*2% Probability of Exceedance in 50 years

MCE = Maximum Considered Earthquake

The Site Coefficients, F_a and F_v presented in the above table were also obtained from the noted USGS webpage as a function of the site classification and mapped spectral response acceleration at the short (S_s) and 1-second (S_1) periods, but can also be interpolated from ASCE Tables 11.4-1 and 11.4-2.

Considering the use of the proposed structures and the values of S_{Ds} and S_{D1} shown above, we expect the structures to fall within **Seismic Design Category D**, as defined by ASCE Tables 11.6-1 and 11.6-2 of the code. Design of structures should comply with the requirements of the governing jurisdiction's building codes and standard practices of the Structural Engineering Association of California.

3.2 SITE PREPARATION & GRADING

The following recommendations are provided for general grading of the site. More detailed geotechnical investigations may be required depending on the proposed development.

3.2.1 SITE PREPARATION

The site should be cleared of all man-made structures, surface vegetation, utilities, and construction debris. Any previous utilities, foundations, seepage pits, or other site improvements found on site in conflict with the new construction should be removed or abandoned in place

below the proposed structures. As a minimum, it is recommended the clearing operations extend at least five feet beyond the building and a few feet beyond the development perimeters.

We recommend that at the time of initial site stripping and grading, that PSI be retained to observe proof-rolling of excavations and subgrade conditions to verify that no potentially deleterious soft soils or unforeseen conditions are present. All excavation bottoms should be firm and unyielding prior to fill being placed above.

Though PSI was not provided with project-specific grading plans, proposed cuts and fills are anticipated within the project site to establish design grades. Any new fill should be placed in accordance with the Engineered Fill section of this report.

If grading occurs in the winter rainy season, unstable subgrade conditions may be present. These conditions may require stabilizing the subgrade with by adding coarse aggregate or admixtures such as cement kiln dust. Isolated areas may be stabilized using a geogrid, such as Tensar TX160 or equal, with one foot compacted Class II aggregate base over the geogrid. Additional recommendations can be provided, as required, during construction.

Asphalt and concrete debris will likely be generated from demolition at the site during construction. These materials may require hauling offsite or may be crushed for placement onsite per geotechnical recommendations or local building authorities.

3.2.2 REMEDIAL GRADING

All undocumented fill materials, within the limits of proposed structures, should be removed and replaced as evaluated by the Geotechnical Engineer or their representative. Existing unsuitable fill soils extending to a depth of 2½ feet bgs near boring location B1 and B2 should be removed and replaced with compacted engineered fill. Areas near boring locations B1, B3, and B4 should be evaluated closely as some soils appear to possibly consist of fill materials to depths of roughly 5 to 7 feet bgs. Loose or soft soils should also be removed and replaced near boring location B1 to a depth of roughly 9 feet bgs. The soils exposed at the base of all excavations should also be scarified to a depth of at least 12 inches, be compacted as described below in Section 3.2.3.

Dependent upon the building locations and their structural loads, some over-excavation of the existing soil and replacement as a properly compacted engineered fill beneath footings may be necessary to limit static settlements to acceptable levels. The need for this over-excavation

should be determined at the time of more detailed investigations and based on specific structural loading information to be provided.

Site grades may then be raised with Engineered Fill to achieve the design elevations proposed for the site. A PSI representative should be on-site during site grading to evaluate the degree of compaction obtained by the contractor.

3.2.3 ENGINEERED FILL

Engineered Fill materials required at this site, including both native and import soil, should not contain rocks greater than 3-inches in diameter or have greater than 30 percent retained on the $\frac{3}{4}$ -inch sieve, and should not contain more than 3 percent (by weight) of organic matter or other unsuitable material. Engineered Fill soils should also have an Expansion Index (EI) that does not exceed 40. Based on our subsurface investigation, existing on-site soils are generally suitable for use as Engineered Fill provided they can be properly moisture conditioned to meet the compaction requirement. This should be confirmed by a PSI representative during grading. Import materials meeting the above requirements should be approved by the Geotechnical Engineer prior to importing to the site. Soil that are environmentally impacted should not be used as Engineered Fill onsite.

Engineered Fill should be compacted to at least 90 percent of the maximum dry density as determined by the modified Proctor (ASTM D1557). The moisture content of Engineered Fill should be maintained between 0 to 2 percent above the material's optimum moisture content during compaction. If the Engineered Fill is too dry, water should be uniformly applied across the affected fill area. If the Engineered Fill is too wet, it must be dried. Engineered Fill should be thoroughly mixed by diskings, or other approved methods, to obtain relatively uniform moisture content throughout the lift immediately prior to compaction.

Engineered Fill should be placed in maximum lifts of 8-inches of loose material. Each lift of Engineered Fill should be tested by a PSI soils technician, working under the direction of our Project Geotechnical Engineer, prior to placement of subsequent lifts. If smaller compaction equipment such as jumping jacks or plate compactors are used thinner lifts may be required to achieve compaction.

Compaction of the backfill should be checked with a sufficient number of density tests by a representative of the Geotechnical Engineer to determine if adequate compaction is being

achieved by the contractor. The properly compacted Engineered Fill should extend horizontally outward beyond the exterior perimeter of the building and foundations a distance equal to the height of fill or 5-feet, whichever is greater, prior to significant sloping. In addition, Engineered Fill should extend horizontally outward beyond the exterior perimeter of pavements and hardscape a distance equal to the height of fill or 3-feet, whichever is greater, prior to significant sloping.

3.3 UTILITY TRENCH CONSTRUCTION

Utility trenches can be backfilled with on-site soils above the utility bedding and shading materials. Trench backfill should be moisture conditioned to between 0 to 2 percent above the optimum moisture content, compacted in 4- to 6-inch lifts to a minimum of 90 percent of the maximum dry density as determined by the modified Proctor (ASTM D1557). If rocks larger than 3-inches in maximum size are encountered, they should be removed from the fill material prior to placement in the utility trenches. Utility bedding and shading compaction requirements should be in conformance with the requirements of the local agencies having jurisdiction, but typically require clean granular material having a sand equivalent equal to or above 30. Jetting or flooding of utility backfill is not recommended.

3.4 SOIL EXPANSION

The expansion potential of representative samples of the existing site soils is low (EI=34 & 35). Such soils must be kept at a constant moisture content to avoid shrinkage and swelling near improvements. Foundation and slab subgrades must be designed for such soils. Landscaping, irrigation, and site grading/drainage must also be designed for such soils as mentioned below. Following site grading, testing of site soils should be performed by the project geotechnical consultant to confirm the basis of these recommendations. Depending upon the distribution of soil types and expansion characteristics, differing design recommendations may be developed to better suit the types of conditions present at the site.

3.5 CORROSION

Testing was performed to evaluate the corrosivity of the on-site soils and the potential for attack on concrete and subsurface cast iron and ductile iron utility pipes. The testing included pH, sulfate, chloride and minimum electrical resistivity. The results of the chemical analysis are as follows:

Table 3 – Corrosion Analyses

Boring Number	Sample Depth (feet)	pH	Minimum Resistivity (Ω -cm)	Soluble Sulfate (ppm)	Soluble Chlorides (ppm)
B3	1½ - 5	7.5	1100	246	145
B6	1 - 5	7.4	1050	576	230

Notes: ppm = parts per million.

Concrete mix design should follow the minimum requirements of the 2016 California Building Code and ACI 318. Laboratory testing of representative near surface soil samples indicates that the on-site soils have very low levels of sulfates such that they are characterized as having a **negligible** corrosion potential with respect to concrete based on ACI 318. Chloride levels also suggest that the site soils are **non-corrosive** to steel (iron/ferrous materials) according to Caltrans specifications. For preliminary design purposes, it is our opinion that the use of Type II cement is suitable for concrete in contact with on-site soils. Final concrete mix design should be evaluated after sulfate and chloride tests have been performed on the actual in-place subgrade material used for finished pad grades.

Based on the minimum resistivity laboratory test results, the soils are characterized as being **highly corrosive** to cast iron or ductile iron piping (National Association of Corrosion Engineers, 1984). PSI does not practice in the field of corrosion engineering. We suggest that a qualified corrosion engineer be consulted to determine if special corrosion protection is warranted. Testing for corrosivity of fill soils should be conducted after site grading.

3.6 SHALLOW FOUNDATIONS

Once proposed structural loadings and foundation plans are available, the geotechnical engineer should evaluate those plans for allowable foundation capacities which depend on the locations of the structures. On a preliminary basis, we would anticipate an allowable soil bearing pressure in the range of 3,000 to 5,000 psf, dependent upon the remedial grading performed. It is our opinion that the proposed buildings having relatively light loadings (150 to 250 kips) can be supported on conventional shallow spread footings bearing on Engineered Fill and/or stiff, or better, native soils, compacted to a firm and unyielding state. More heavily loaded foundations (>250 kips) may require deeper foundations or a ground improvement program to be more effective and to limit settlements to a tolerable level. Structures placed near boring location B3

should consider potential settlement issues. The size of the foundations, the bearing pressure and the embedment depth have a direct impact on the anticipated settlement. Once specific plans are developed and once detailed structural loading information is known, additional test borings and engineering analysis will be necessary.

3.7 SLABS ON GRADE

We anticipate that the proposed buildings may use slab-on-grade construction supported on Engineered Fill and/or suitable existing soil provided the subgrade has been prepared as described in Section 3.2 of this report. Soft or otherwise unsuitable areas observed should be addressed on a case-by-case basis by our Geotechnical Engineer.

Due to the presence of low expansive soils, we recommend that the subgrade soils beneath the building floor slab be moisture conditioned to 0 to 2 percent above the soil's optimum moisture content to a depth of at least 12 inches. This moisture conditioning is recommended to be verified by the geotechnical engineer within 48 hours of floor slab concrete placement. Floor slabs should have a nominal thickness of 5 inches and be reinforced with at least No. 3 bars placed at 18-inches centers each way. Additional steel reinforcement may be required for structural considerations.

To reduce moisture vapor transmission into interior spaces, we recommend a 10-mil vapor retarding membrane be included beneath slabs. Membrane specifications should be provided by the flooring manufacturer. Vapor retarders should be installed in accordance with ACI 302.1R and should extend to footings with no breaks (sealed between footings and around penetrations). A minimum 2 inch thick capillary break material (clean sand) should be provided above and below the vapor retarder to help protect the vapor barrier from punctures and to allow more uniform curing of the concrete slab.

This vapor retarder system is anticipated to be suitable for most flooring finishes that can accommodate some vapor emissions. However, this system may emit more than 3 pounds of water per 1000 square feet and therefore, may not be suitable for all flooring finishes. Additional steps should be taken if such vapor emission levels are too high for anticipated flooring finishes.

Exterior slabs should be isolated from the building. These slabs should be reinforced to function as independent units. Movement of these slabs should not be transmitted to the building

foundation or superstructure. We also recommend that expansive subgrade soils beneath concrete flatwork be moisture treated similar to that recommended for on-grade floor slabs.

The precautions listed below should be followed closely for construction of all slabs-on-grade. These details will not reduce the amount of movement, but are intended to reduce potential damage should some settlement of the supporting subgrade take place.

- Cracking of slabs-on-grade is normal and should be expected. Cracking can occur not only because of heaving or compression of the supporting soil, but also because of concrete curing stresses. The occurrence of concrete shrinkage cracks, and problems associated with concrete curing may be reduced and/or controlled by limiting the water/cement ratio of the concrete, proper concrete placement, finishing, and curing, and by the placement of crack control joints at frequent intervals, particularly, where re-entrant slab corners occur. The American Concrete Institute (ACI) recommends a maximum panel size (in feet) equal to approximately three times the thickness of the slab (in inches) in both directions. For example, joints are recommended at a maximum spacing of 12 feet, assuming a four-inch thick slab. We recommend also that control joints be scored three feet in from, and parallel to, the foundation walls. Using fiber reinforcement in the concrete can also help control shrinkage cracking.
- Some increase in moisture content is inevitable because of development and associated landscaping. However, extreme moisture content increases can be largely controlled by proper and responsible site drainage, building maintenance and irrigation practices. Landscaping and irrigation should be minimized immediately adjacent to buildings.

3.8 SETTLEMENT

Proposed loadings and structural foundation plans should be reviewed by the geotechnical engineer to accurately estimate settlements. Foundations (column loads <250 kips) designed and constructed in accordance with typical geotechnical recommendations are estimated to experience post-construction total settlements generally less than about 1-inch with differential settlement along a 40-foot long portion of a continuous footing, or similarly spaced column footings generally less than ½-inch. Total and differential settlements of these magnitudes are usually considered tolerable for the anticipated construction. However, the tolerance of proposed structures to predicted total and differential settlements should be confirmed by the structural engineer.

As previously noted, a seismic-induced settlement of about 0.7 inch with a corresponding differential seismic settlement of less than ½ inch over a 40 foot span is possible. Although these seismic settlements are well within levels considered tolerable (per SP 117A), we recommend that the structural engineer consider the seismic settlements in their design.

3.9 RETAINING WALLS

Standard retaining walls may be designed simply for walls up to a maximum height of six feet. Retaining walls above a height of six feet will require seismic loadings incorporated. Such walls may rely on shallow foundation recommendations to be provided.

Onsite clay soils are not considered suitable for retaining wall backfill. Clean granular soil backfill should be used from the site or imported. The backfill material should be compacted to at least 90 percent of the maximum dry density as determined by ASTM D1557 with optimum moistures within 0 to 2 percent above optimum. Compaction may be checked by probing if needed. Flooding or jetting of the backfill should not be permitted. Granular backfill should be capped with 12-inches of relatively impervious fill (clayey soils, concrete, CDF) or pavements to seal the backfill and reduce the potential for infiltration and saturation. It should be noted that the use of heavy compaction equipment in close proximity to retaining structures could result in wall pressures exceeding design values and causing wall movement. In this regard, the contractor should take appropriate precautions during the backfill placement and use relatively light compaction equipment.

For drained conditions, a back-drainage system should be installed to drain any water that may collect behind retaining walls. The drainage system should consist of a 1 cubic foot per foot burrito drain containing free-draining crushed rock (5%<#200) placed adjacent to the wall. The gravel should be completely enclosed in an approved filter fabric (Mirafi 140N, or equivalent) to separate the gravel and backfill soil. A 4-inch diameter perforated SCH-40 PVC pipe should be placed with perforations down, behind the bottom of the retaining wall at a gradient of at least one percent. Drainage outlets should be 4-inch diameter solid SCH-40 PVC pipe, installed to drain to an appropriate outlet. Drainage should be conducted away from structural foundations. Weep holes may be used if desired. The project geotechnical engineer should approve any alternative drain system.

Waterproofing the back of the retaining walls should be considered to mitigate water staining, infiltration, and moisture migration through the wall. If a waterproofing system is used, it should be designed by a qualified waterproofing consultant.

3.10 PAVEMENT DESIGN

In designing the proposed pavement areas, the following conditions were considered:

1. Subgrade support characteristics are typically represented by an R-Value for the design of flexible pavements in this region.
2. Vehicular traffic volumes, in terms of the number and frequency of vehicles and their range of axle loads should be considered.
3. Likely changes in vehicular use over the life of the pavement should also be considered. We have assumed that the pavement areas will not experience additional traffic.
4. Pavement life cycle was considered to be 20 years.

All site preparations and grading should be performed as discussed above in Section 3.2.

Since an evaluation of the characteristics of the actual soils present at pavement subgrade can only be provided at the completion of grading, the following pavement sections should be used for planning purposes only. Final pavement designs should be evaluated after R-value tests have been performed on the actual in-place subgrade materials exposed for use during construction.

It should be noted that additional earthwork and/or ground improvement efforts may be required during grading on the actual subgrade material encountered, in order to achieve the aforementioned design parameters and assumptions. These design thicknesses assume that a properly prepared subgrade has been achieved.

Based on the results of our field exploration and laboratory testing of sandy clay (worse case scenario), we recommend the pavement designs presented in the table below. The pavement design criteria are based on the soil conditions present at the site, an R-value of 6 and the Traffic Index indicated below based on the estimated traffic for the site. In more granular areas of the site, a thinner pavement section may be used if desired and designed.

Table 4 - Pavement Section Recommendations

Location	Traffic Index (TI)	Asphalt Thickness (inches)	+	Aggregate Base Thickness (inches)	Portland Cement Concrete Thickness (inches)	+	Aggregate Base Thickness (inches)
Standard Drive Aisles	5	3½	+	8½	5½	+	4
		4	+	7½			
Truck Drive Aisles	7	6	+	12	6	+	6
		7	+	10			

We recommend rigid pavements (Portland Cement Concrete, PCC) be constructed at all areas requiring heavy braking and turning such as intersections, entrances, docking bays, trash truck loading areas, etc. PCC pavement sections should incorporate appropriate steel reinforcement and crack control joints as designed by the project structural engineer. We recommend that sections be as nearly squared as possible and no more than 15-feet on a side. Score joints may be constructed by saw cutting to a depth of ¼ of the slab thickness. Expansion/cold joints may be used in lieu of score joints. Such joints should be properly sealed. A minimum 4,000 psi mix is recommended.

Prior to placement of aggregate base, subgrade soils should be proof-rolled and scarified to a depth of 12 inches, brought to moisture contents between 0 to 2 percent above optimum, then compacted to at least 95 percent of the laboratory standard. The laboratory standard should be ASTM D1557.

Aggregate base below pavement sections should be compacted to at least 95 percent of ASTM D1557 with moisture contents within +/-2 percent of optimum. Aggregate base materials should be Caltrans Class II Base.

All materials should conform to and be placed in accordance with the latest revision of the Standard Specifications for Public Works Construction (Greenbook), the American Concrete Institute (ACI), and the Portland Cement Association (PCA).

3.11 LANDSCAPING AND IRRIGATION

Landscaping and irrigation should be positioned away from the building by at least 5 feet. Trees and shrubs should be positioned a distance away from the building equal to half of their mature height. Hardscape should closely surround the building as much as possible. Moisture conditions within the soil should be maintained at a constant level to avoid wetting or drying and associated movements. If landscaping is desired closer to the building, moisture barriers may be added to limit moisture infiltration beneath the building.

3.12 CONSTRUCTION CONSIDERATIONS

The site soils are sensitive to disturbances caused by construction traffic and to changes in moisture content. During wet weather periods, increases in the moisture content of the soil can cause significant reduction in the soil strength and support capabilities. Furthermore, perched groundwater conditions can develop during periods of heavy rainfall as a result of less permeable layers impeding infiltration. In these instances, overlying subgrade soils may become unstable and require remedial measures. It will, therefore, be advantageous to perform earthwork and foundation construction activities during dry weather.

Groundwater was not encountered near the ground surface during our explorations onsite. It should be noted, however, that variations in the groundwater table may result from fluctuation in the ground surface topography, subsurface stratification, precipitation, irrigation, and other factors that may not have evident at the time of our exploration. This sometimes occurs where relatively impermeable and/or cemented materials are overlain by fill soils. We recommend that a representative of PSI be present during grading operations to evaluate areas of seepage. Drainage devices for reduction of water accumulation can be recommended if these conditions occur.

Water should not be allowed to collect in the foundation excavation, on floor slab areas, or on prepared subgrades of the construction area either during or after construction. Undercut or excavated areas should be sloped toward one corner to facilitate removal of any collected rainwater, groundwater, or surface runoff. Positive site drainage should be provided to reduce infiltration of surface water around the perimeter of the building and beneath the floor slabs during construction.

Final grading should be designed to provide positive drainage away from proposed structures. Soil areas within 10-feet of proposed structures should sloped at a minimum of 5 percent away from the structure, if possible. Roof leaders and downspouts should discharge onto paved surfaces sloping away from the structure or into a closed pipe system which outfalls to the street gutter or directly to the storm drain system.

4 REPORT LIMITATIONS

The proposed professional services have been performed, findings obtained, and preliminary recommendations prepared in accordance with generally accepted geotechnical engineering principles and practices at the time of this report. PSI is not responsible for the conclusions, opinions, or recommendations made by others based on this data. No other warranties are implied or expressed. **Simon**, its subsidiaries and affiliates can rely upon the report under the same terms as if it was originally prepared for them.

The scope of exploration was intended to evaluate soil conditions within the influence of the proposed development. The analyses and recommendations submitted in this report are based upon the data obtained from the soil borings performed at the locations indicated. If any subsoil variations become evident during the course of this project, a re-evaluation of the recommendations contained in this report will be necessary after we have had an opportunity to observe the characteristics of the conditions encountered. The applicability of the report should also be reviewed in the event significant changes occur in the design, nature, or location of the proposed structural.

This report is considered preliminary based on limited knowledge of the proposed development. The preliminary recommendations provided herein are only intended for feasibility evaluations and conceptual designs and should not be relied upon for final design recommendations. Future design concepts and plans will require further focused geotechnical investigations to determine final design and construction recommendations for specific development structures.

BORING LOGS

GENERAL NOTES

SAMPLE IDENTIFICATION

The Unified Soil Classification System (USCS), AASHTO 1988 and ASTM designations D2487 and D-2488 are used to identify the encountered materials unless otherwise noted. Coarse-grained soils are defined as having more than 50% of their dry weight retained on a #200 sieve (0.075mm); they are described as: boulders, cobbles, gravel or sand. Fine-grained soils have less than 50% of their dry weight retained on a #200 sieve; they are defined as silts or clay depending on their Atterberg Limit attributes. Major constituents may be added as modifiers and minor constituents may be added according to the relative proportions based on grain size.

DRILLING AND SAMPLING SYMBOLS

SFA: Solid Flight Auger - typically 4" diameter flights, except where noted.	☒ SS: Split-Spoon - 1 3/8" I.D., 2" O.D., except where noted.
HSA: Hollow Stem Auger - typically 3 1/4" or 4 1/4" I.D. openings, except where noted.	■ ST: Shelby Tube - 3" O.D., except where noted.
M.R.: Mud Rotary - Uses a rotary head with Bentonite or Polymer Slurry	▮ RC: Rock Core
R.C.: Diamond Bit Core Sampler	↓ TC: Texas Cone
H.A.: Hand Auger	☞ BS: Bulk Sample
P.A.: Power Auger - Handheld motorized auger	☒ PM: Pressuremeter
	CPT-U: Cone Penetrometer Testing with Pore-Pressure Readings

SOIL PROPERTY SYMBOLS

N: Standard "N" penetration: Blows per foot of a 140 pound hammer falling 30 inches on a 2-inch O.D. Split-Spoon.
N ₆₀ : A "N" penetration value corrected to an equivalent 60% hammer energy transfer efficiency (ETR)
Q _u : Unconfined compressive strength, TSF
Q _p : Pocket penetrometer value, unconfined compressive strength, TSF
w%: Moisture/water content, %
LL: Liquid Limit, %
PL: Plastic Limit, %
PI: Plasticity Index = (LL-PL), %
DD: Dry unit weight, pcf
▼, ▽, ▾ Apparent groundwater level at time noted

RELATIVE DENSITY OF COARSE-GRAINED SOILS ANGULARITY OF COARSE-GRAINED PARTICLES

Relative Density	N - Blows/foot	Description	Criteria
Very Loose	0 - 4	Angular:	Particles have sharp edges and relatively plane sides with unpolished surfaces
Loose	4 - 10	Subangular:	Particles are similar to angular description, but have rounded edges
Medium Dense	10 - 30	Subrounded:	Particles have nearly plane sides, but have well-rounded corners and edges
Dense	30 - 50	Rounded:	Particles have smoothly curved sides and no edges
Very Dense	50 - 80		
Extremely Dense	80+		

GRAIN-SIZE TERMINOLOGY

Component	Size Range
Boulders:	Over 300 mm (>12 in.)
Cobbles:	75 mm to 300 mm (3 in. to 12 in.)
Coarse-Grained Gravel:	19 mm to 75 mm (3/4 in. to 3 in.)
Fine-Grained Gravel:	4.75 mm to 19 mm (No.4 to 3/4 in.)
Coarse-Grained Sand:	2 mm to 4.75 mm (No.10 to No.4)
Medium-Grained Sand:	0.42 mm to 2 mm (No.40 to No.10)
Fine-Grained Sand:	0.075 mm to 0.42 mm (No. 200 to No.40)
Silt:	0.005 mm to 0.075 mm
Clay:	<0.005 mm

PARTICLE SHAPE

Description	Criteria
Flat:	Particles with width/thickness ratio > 3
Elongated:	Particles with length/width ratio > 3
Flat & Elongated:	Particles meet criteria for both flat and elongated

RELATIVE PROPORTIONS OF FINES

Descriptive Term	% Dry Weight
Trace:	< 5%
With:	5% to 12%
Modifier:	>12%

GENERAL NOTES

(Continued)

CONSISTENCY OF FINE-GRAINED SOILS

<u>Q_u - TSF</u>	<u>N - Blows/foot</u>	<u>Consistency</u>
0 - 0.25	0 - 2	Very Soft
0.25 - 0.50	2 - 4	Soft
0.50 - 1.00	4 - 8	Firm (Medium Stiff)
1.00 - 2.00	8 - 15	Stiff
2.00 - 4.00	15 - 30	Very Stiff
4.00 - 8.00	30 - 50	Hard
8.00+	50+	Very Hard

MOISTURE CONDITION DESCRIPTION

<u>Description</u>	<u>Criteria</u>
Dry:	Absence of moisture, dusty, dry to the touch
Moist:	Damp but no visible water
Wet:	Visible free water, usually soil is below water table

RELATIVE PROPORTIONS OF SAND AND GRAVEL

<u>Descriptive Term</u>	<u>% Dry Weight</u>
Trace:	< 15%
With:	15% to 30%
Modifier:	>30%

STRUCTURE DESCRIPTION

<u>Description</u>	<u>Criteria</u>	<u>Description</u>	<u>Criteria</u>
Stratified:	Alternating layers of varying material or color with layers at least ¼-inch (6 mm) thick	Blocky:	Cohesive soil that can be broken down into small angular lumps which resist further breakdown
Laminated:	Alternating layers of varying material or color with layers less than ¼-inch (6 mm) thick	Lensed:	Inclusion of small pockets of different soils
Fissured:	Breaks along definite planes of fracture with little resistance to fracturing	Layer:	Inclusion greater than 3 inches thick (75 mm)
Slickensided:	Fracture planes appear polished or glossy, sometimes striated	Seam:	Inclusion 1/8-inch to 3 inches (3 to 75 mm) thick extending through the sample
		Parting:	Inclusion less than 1/8-inch (3 mm) thick

SCALE OF RELATIVE ROCK HARDNESS

<u>Q_u - TSF</u>	<u>Consistency</u>
2.5 - 10	Extremely Soft
10 - 50	Very Soft
50 - 250	Soft
250 - 525	Medium Hard
525 - 1,050	Moderately Hard
1,050 - 2,600	Hard
>2,600	Very Hard

ROCK BEDDING THICKNESSES

<u>Description</u>	<u>Criteria</u>
Very Thick Bedded	Greater than 3-foot (>1.0 m)
Thick Bedded	1-foot to 3-foot (0.3 m to 1.0 m)
Medium Bedded	4-inch to 1-foot (0.1 m to 0.3 m)
Thin Bedded	1¼-inch to 4-inch (30 mm to 100 mm)
Very Thin Bedded	½-inch to 1¼-inch (10 mm to 30 mm)
Thickly Laminated	1/8-inch to ½-inch (3 mm to 10 mm)
Thinly Laminated	1/8-inch or less "paper thin" (<3 mm)

ROCK VOIDS

<u>Voids</u>	<u>Void Diameter</u>
Pit	<6 mm (<0.25 in)
Vug	6 mm to 50 mm (0.25 in to 2 in)
Cavity	50 mm to 600 mm (2 in to 24 in)
Cave	>600 mm (>24 in)

GRAIN-SIZED TERMINOLOGY

(Typically Sedimentary Rock)	
<u>Component</u>	<u>Size Range</u>
Very Coarse Grained	>4.76 mm
Coarse Grained	2.0 mm - 4.76 mm
Medium Grained	0.42 mm - 2.0 mm
Fine Grained	0.075 mm - 0.42 mm
Very Fine Grained	<0.075 mm

ROCK QUALITY DESCRIPTION

<u>Rock Mass Description</u>	<u>RQD Value</u>
Excellent	90 - 100
Good	75 - 90
Fair	50 - 75
Poor	25 - 50
Very Poor	Less than 25

DEGREE OF WEATHERING

Slightly Weathered:	Rock generally fresh, joints stained and discoloration extends into rock up to 25 mm (1 in), open joints may contain clay, core rings under hammer impact.
Weathered:	Rock mass is decomposed 50% or less, significant portions of the rock show discoloration and weathering effects, cores cannot be broken by hand or scraped by knife.
Highly Weathered:	Rock mass is more than 50% decomposed, complete discoloration of rock fabric, core may be extremely broken and gives clunk sound when struck by hammer, may be shaved with a knife.

SOIL CLASSIFICATION CHART

PERCOLATION TEST RESULTS

Boring Percolation Test Datasheet

Client: Simon

Test Date: 2/2/2018

Project: Brea Mall

Work Order No.: 00661261

Address: 100 Brea Mall

Technician: Lloyd Guss + Manny R.

Brea, CA

Weather: Sunny, Clear

Test Hole Number/Location: B3

Depth of Total Test Hole bottom below land surface (inches): 9.5 ft.

Test hole cross-section (check a box and indicate size):

☒ Diameter: 8 inches

☐ Square: _____ inches

The land surface at the top of the test hole is (check one):

☐ Undisturbed Native Soil

☐ Cut Surface

☐ Fill Surface

☒ Other (describe): Paved Parking Lot

Soil Data from Test Hole:

Depth (ft)	Soil Texture
0 - 4.75	Sandy Clay
4.75 - 7	Silty Sand
7 - 28	Silty Clay

Perforated PVC Pipe Diameter = 4"

Solid end cap on pipe.

Pipe Length = 10.25' (10'3")

Stick up above asphalt = 18"

Depth of water during testing =

35.16 inches

Average Head during testing =

35.1 inches

Test Hole Presoaking

Presoak >12in. = If drains away in 30 min. (x2), Test @10min. If not, Test @30min.

1. Introduction

1.1 PURPOSE OF MITIGATION MONITORING AND REPORTING PROGRAM

This Mitigation Monitoring and Reporting Program (MMRP) has been developed to provide a vehicle by which to monitor mitigation measures and conditions of approval outlined in the Draft Environmental Impact Report (DEIR), State Clearinghouse No. 2019080299. The Mitigation Monitoring and Reporting Program has been prepared in conformance with Section 21081.6 of the Public Resources Code and City of Brea Monitoring Requirements. Section 21081.6 states:

- (a) When making findings required by paragraph (1) of subdivision (a) of Section 21081 or when adopting a mitigated negative declaration pursuant to paragraph (2) of subdivision (c) of Section 21080, the following requirements shall apply:
 - (1) The public agency shall adopt a reporting or monitoring program for the changes made to the project or conditions of project approval, adopted in order to mitigate or avoid significant effects on the environment. The reporting or monitoring program shall be designed to ensure compliance during project implementation. For those changes which have been required or incorporated into the project at the request of a responsible agency or a public agency having jurisdiction by law over natural resources affected by the project, that agency shall, if so requested by the lead or responsible agency, prepare and submit a proposed reporting or monitoring program.
 - (2) The lead agency shall specify the location and custodian of the documents or other material which constitute the record of proceedings upon which its decision is based.

1.2 PROJECT LOCATION

The project site is developed as the existing Brea Mall, at 1065 Brea Mall, City of Brea, and encompasses approximately 74 acres in northeast Orange County. The project site consists of the following Accessor's Parcel Numbers (APNs): 319-101-26, -37, -62, -63, -64, -71, -73, -75, -76, -79, -80, and 319-103-22. The project site is surrounded by commercial and residential uses and is bounded by East Birch Street to the north, State College Boulevard to the east, Imperial Highway to the south, and South Randolph Avenue to the west. The City of Brea is bordered by the cities of La Habra to the northwest, Fullerton to the southwest and south; Placentia to the south; Yorba Linda to the southeast and east; unincorporated Orange County to the east, northeast, and north; Chino Hills (San Bernardino County) to the northeast; and unincorporated Los Angeles to the northeast.

1. Introduction

1.3 PROJECT DESCRIPTION

As a result of the recent acquisition of the Sears parcel, the Simon Property Group (Simon Properties, or Applicant) is proposing redevelopment of the Sears parcel and adjoining transition areas adjacent to Nordstrom and Macy's on the southwest portion of the Brea Mall. The project area would be up to 17.5 acres. The proposed project involves demolishing the Sears department store and associated auto center (161,990 square feet) and 12 acres of surface parking in order to allow a mix of uses—including retail, for-rent residential apartments, a resort-type fitness center, and a gathering space (large “central green” and plaza). Table 1, *Brea Mall Mixed Use Project Land Use Summary*, provides a summary of the existing and proposed square footages of the site.

Table 1 Brea Mall Mixed Use Project Land Use Summary

Tenant	Existing Commercial Square Feet (sq. ft.)	Demolition (sq. ft.)	New Construction Commercial Square Feet (sq. ft.)	Total Brea Mall Commercial Square Feet (sq. ft.)
Major Department Stores				
Sears	161,990	-161,990	—	0
Macy's ¹	182,360	—	—	182,360
Nordstrom	176,540	—	—	176,540
JC Penny	135,800	—	—	135,800
Macy's Men & Home	192,060	—	—	192,060
Major Department Stores	848,750	-161,990	0	686,760
Other Commercial				
Sporting Goods	—	—	50,019	50,019
Fitness Center	—	—	128,000	128,000
Level 1 Mall	224,522	—	123,053	347,575
Level 2 Mall	207,992	—	10,543	218,535
Total Other Commercial	432,514	0	311,615	744,129
Outlots¹				
Cheesecake Factory Outlot	10,169	—	—	10,169
Total Mall	1,291,433	-161,990	311,615	1,441,058
Mixed-Use Residential				
Medium Density Residential (7-story) ²	—	—	312 units	312 units
Residential Square Feet	—	—	382,994	
Net Change from Existing	—	—	312 units	149,625

¹ Macy's owns the buildings occupied by Red Lobster and Olive Garden; therefore, the commercial square footage for Macy's includes these restaurants. BJ's is not owned by Simon Properties or the retail anchors; therefore, the square footage for this outlot facility is not included in this table.

² Approximately 60.5 feet above grade at roof height and up to 82 feet and 3 inches above grade at parapet.

1. Introduction

1.4 ENVIRONMENTAL IMPACTS

1.4.1 Impacts Considered No Impact or Less Than Significant

The EIR identified various thresholds from the CEQA Guidelines among a number of environmental categories that would not be significantly impacts by the proposed project in Chapter 5, *Environmental Analysis*, and Chapter 8, *Impacts Found Not to Be Significant*, and therefore, did not require mitigation. Impacts to the following environmental resources were found to be less than significant or no impact:

- Aesthetics
- Agriculture and Forestry Resources
- Biological Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hydrology and Water Quality
- Land Use and Planning
- Mineral Resources
- Noise
- Population and Housing
- Public Services
- Recreation
- Utilities and Service Systems
- Wildlife

1.4.2 Potentially Significant Adverse Impacts That Can Be Mitigated, Avoided, or Substantially Lessened

The EIR concluded that the proposed project could result in one or more potentially significant impacts in the following topic areas:

- Air Quality
- Cultural and Paleontological Resources
- Hazards and Hazardous Materials
- Tribal Cultural Resources

However, the EIR also found that these impacts would be reduced, avoided, or substantially lessened through the implementation of mitigation measures, which are listed in Table 2.

1.4.3 Unavoidable Significant Adverse Impacts

The following impact would remain significant and unavoidable after implementation of required mitigation, as identified in the EIR:

- Transportation (impacts to Caltrans-owned facilities)

1. Introduction

This page intentionally left blank.

2. Mitigation Monitoring Requirements

2.1 CATEGORIZED MITIGATION MEASURES/MATRIX

Project-specific mitigation measures (MM) and plans, programs, and policies (PPPs) have been categorized in matrix format, as shown in Table 2. The matrix identifies the environmental factor, specific mitigation measures, schedule, and responsible monitor. The mitigation matrix will serve as the basis for scheduling the implementation of, and compliance with, all mitigation measures.

2. Mitigation Monitoring Requirements

This page intentionally left blank.

2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

Mitigation Measure		Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
AESTHETICS					
PPP AES-1	The proposed project is required to provide a minimum landscaped coverage of 15 percent of the net site area in accordance with Municipal Code Section 20.258.020, General Development Standards for the Mixed-Use Zoning Districts.	Project Applicant	Prior to issuance of building permits.	City of Brea Planning Division	
PPP AES-2	For parking areas, the proposed project is required to maintain an equivalent of one foot candle of illumination on the average throughout the parking area. The lighting is required to be on a time-clock or photo-sensor system. The lighting shall be designed to confine direct rays to the premises. No spillover beyond the property line shall be permitted in accordance with Municipal Code Section 20.08.040(C)(5), Lighting.	Project Applicant	Prior to issuance of building permits.	City of Brea Engineering Department	
PPP AES-3	All lighting, interior and exterior, shall be designed and located so as to confine all direct rays to the premises in accordance with Municipal Code Section 20.220.040(L), Lighting. Lighting for nonresidential uses shall be appropriately designed, located, and shielded to ensure that they do not negatively impact the residential uses in compliance with Section 20.08.040 (C)(5).	Project Applicant	Prior to issuance of building permits.	City of Brea Engineering Department	
PPP AES-4	Signs shall be located in a manner to assure that sight distance is not impaired at all locations for vehicular traffic to and from the premises, in accordance with Municipal Code Section 20.28, Signs. Amendments to the existing signage program for erections of a new sign at the Mall entrance requires review of the Planning Commission to ensure that its size, location, movement, content, coloring, or manner of illumination, does not constitute a traffic hazard or a detriment to traffic safety by obstructing the vision of drivers, or detracting from the visibility of any official traffic control device, or by diverting or tending to divert the attention of drivers of moving vehicles from the traffic movement on the public streets and highway.	Project Applicant	Prior to issuance of building permits.	City of Brea Engineering Department	

2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

Mitigation Measure		Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
PPP AES-5	Loading areas. Loading areas for nonresidential uses shall be located as far as possible from residential units and shall be completely screened from view from the residential portion of the project and streets in compliance with subsections 20.236.040. E, Walls and Fences, and 20.220.040. F, Fences, Walls, and Hedges, and subparagraph K. Screening and buffering standards Loading areas shall be compatible in architectural design and details with the overall project. The location and design of loading areas shall mitigate nuisances from odors when residential uses might be impacted in accordance with Section 20.258.030 (I)(3) Loading Areas.	Project Applicant	Prior to issuance of building permits.	City of Brea Engineering Department	
PPP AES-6	Recycling and refuse storage facilities for nonresidential uses shall be located as far as possible from residential units and shall be completely screened from view from the residential portion of the project and streets in compliance with Section 20.236.040.E. Walls and Fences, and 20.220.040.F, Fences, Walls, and Hedges, and subparagraph K, Screening and buffering standards. Recycling and refuse storage facilities for nonresidential uses should be compatible in architectural design and details with the overall project. The location and design of trash enclosures shall mitigate nuisances from odors when residential uses might be impacted in accordance with Section 20.258.030 (J) Recycling and refuse storage facilities standards.	Project Applicant	Prior to issuance of building permits.	City of Brea Planning Division	
AIR QUALITY					
PPP AIR-1	New buildings are required to achieve the current California Building Energy and Efficiency Standards (Title 24, Part 6) and California Green Building Standards Code (CALGreen) (Title 24, Part 11). The 2016 Building and Energy Efficiency Standards were effective starting on January 1, 2017, and the 2019 Building and Energy Efficiency Standards will become effective January 1, 2020. The Building Energy and Efficiency Standards and CALGreen are updated tri-annually with a goal to achieve zero net energy for residential buildings by 2020 and nonresidential buildings by 2030.	Project Applicant	Prior to issuance of building permits.	City of Brea Engineering Department	

2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

	Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
PPP AIR-2	New buildings are required to adhere to the California Green Building Standards Code (CALGreen) requirement to provide bicycle parking for new nonresidential buildings, or meet local bicycle parking ordinances, whichever is stricter (CALGreen Sections 5.106.4.1, 14.106.4.1, and 5.106.4.1.2).	Project Applicant	Prior to issuance of building permits.	City of Brea Engineering Department	
PPP AIR-3	Construction activities will be conducted in compliance with California Code of Regulations Title 13, Section 2499, which requires that nonessential idling of construction equipment is restricted to five minutes or less.	Construction contractor	During construction activities	City of Brea Planning Division	
PPP AIR-4	Construction activities will be conducted in compliance with any applicable South Coast Air Quality Management District rules and regulations, including but not limited to the following: ▪ Rule 403, Fugitive Dust, for controlling fugitive dust and avoiding nuisance. ▪ Rule 402, Nuisance, which states that a project shall not "discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property." ▪ Rule 1113, which limits the volatile organic compound content of architectural coatings	Construction contractor	During construction activities	City of Brea Planning Division	

2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

Mitigation Measure		Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
AQ-1	The construction contractor(s) shall, at minimum, use equipment that meets the United States Environmental Protection Agency's (USEPA) Tier 4 (Final) emissions standards for off-road diesel-powered construction equipment with more than 50 horsepower. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by Tier 4 emissions standards for a similarly sized engine, as defined by the California Air Resources Board's regulations. Prior to construction, the project engineer shall ensure that all plans clearly show the requirement for USEPA Tier 4 emissions standards for construction equipment over 50 horsepower for the specific activities stated above. During construction, the construction contractor shall maintain a list of all operating equipment associated with building demolition in use on the site for verification by the City. The construction equipment list shall state the makes, models, and numbers of construction equipment onsite. Equipment shall be properly serviced and maintained in accordance with the manufacturer's recommendations.	Construction contractor	During construction activities	City of Brea Planning Division	
CULTURAL AND PALEONTOLOGICAL RESOURCES					
PPP CUL-1	Native American historical and cultural resources and sacred sites are protected under PRC Sections 5097.9 to 5097.991, which require that descendants be notified when Native American human remains are discovered and provide for treatment and disposition of human remains and associated grave goods.	Qualified Archaeologist and Project Applicant	Prior to issuance of grading permits and during construction activities	City of Brea Planning Division	
PPP CUL-2	The removal, without permission, of any paleontological site or feature is prohibited from lands under the jurisdiction of the state or any city, county, district, authority, or public corporation, or any agency thereof (PRC Section 5097.5). This applies to agencies' own activities, including construction and maintenance, and permit actions by others.	Qualified Archaeologist and Project Applicant	Prior to issuance of grading permits and during construction activities	City of Brea Planning Division	
PPP CUL-3	Adverse impacts to paleontological resources from developments on public (state, county, city, and district) lands require reasonable mitigation. (PRC Section 5097.5)	Qualified Archaeologist and Project Applicant	Prior to issuance of grading permits and during construction activities	City of Brea Planning Division	

2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

	Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
PPP CUL-4	If human remains are discovered within a project site, disturbance of the site must stop until the coroner has investigated and made recommendations for the treatment and disposition of the human remains to the person responsible for the excavation, or to his or her authorized representative. If the coroner has reason to believe the human remains are those of a Native American, he or she shall contact, by telephone within 24 hours, the Native American Heritage Commission. (California Health and Safety Code Section 7050.5)	Tribal Monitor, Qualified Archaeologist, and Project Applicant	During site-grading activities	City of Brea Planning Division, Project Applicant	
CUL-1	Prior to issuance of grading permits, a qualified archaeological monitor shall be identified to be on call during ground-disturbing activities. If archaeological resources are discovered during excavation and/or construction activities, construction shall stop within 50 feet of the find, and the qualified archaeologist shall be consulted to determine whether the resource requires further study. The archaeologist shall make recommendations to the City of Brea to protect the discovered resources. Archaeological resources recovered shall be provided to an accredited museum such as the John D. Cooper Center in Fullerton or any other local museum or repository willing and able to accept and house the resource to preserve for future scientific study.	Qualified Archaeologist and Project Applicant	Prior to issuance of grading permits and during construction activities	City of Brea Planning Division	
CUL-2	Prior to construction, a qualified paleontologist shall monitor all excavations below five feet. If unique paleontological resources are discovered during excavation and/or construction activities, construction shall stop within 50 feet of the find, and the qualified paleontologist shall be consulted to determine whether the resource requires further study. The paleontologist shall make recommendations to the City of Brea to protect the discovered resources. Any paleontological resources recovered shall be provided for curation at a local curation facility such as the Los Angeles County Natural History Museum, the John D. Cooper Center in Fullerton, or any other local museum or repository willing and able to accept and house the resource to preserve for future scientific study.	Qualified Paleontologist and Project Applicant	Prior to construction or during construction activities	City of Brea Planning Division	

2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

Mitigation Measure		Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
ENERGY AND GREENHOUSE GAS EMISSIONS					
PPP E-1 PPP GHG-1	New buildings are required to achieve the current California Building Energy Efficiency Standards (Title 24, Part 6) and California Green Building Standards Code (CALGreen) (Title 24, Part 11). The 2016 Building Energy Efficiency Standards were effective starting January 1, 2017. The 2019 Building Energy Efficiency Standards will become effective on January 1, 2020. The Building Energy Efficiency Standards and CALGreen are updated tri-annually with a goal to achieve zero net energy for residential buildings by 2020 and non-residential buildings by 2030.	Project Applicant	Prior to issuance of building permits.	City of Brea Engineering Department	
PPP E-2 PPP GHG-2	New buildings are required to adhere to the California Green Building Standards Code (CALGreen) requirement to provide bicycle parking for new non-residential buildings, or meet local bicycle parking ordinances, whichever is stricter (CALGreen Sections 5.106.4.1, 14.106.4.1, and 5.106.4.1.2).	Project Applicant	Prior to issuance of building permits.	City of Brea Engineering Department	
PPP E-3 PPP GHG-3	California's Green Building Standards Code (CALGreen) requires the recycling and/or salvaging for reuse at minimum of 65 percent of the nonhazardous construction and demolition waste generated during most "new construction" projects (CALGreen Sections 4.408 and 5.408). Construction contractors are required to submit a construction waste management plan that identifies the construction and demolition waste materials to be diverted from disposal by recycling, reuse on the project, or salvaged for future use or sale and the amount (by weight or volume).	Project Applicant	Prior to issuance of building permits and during construction.	City of Brea Engineering Department	
PPP E-4 PPP GHG-4	Construction activities are required to adhere to Title 13 California Code of Regulations Section 2499, which requires that nonessential idling of construction equipment is restricted to five minutes or less.	Project Applicant	Prior to issuance of building permits.	City of Brea Engineering Department	
PPP E-5 PPP GHG-5	New buildings are required to adhere to the California Green Building Standards Code and Water Efficient Landscape Ordinance requirements to increase water efficiency and reduce urban per capita water demand.	Project Applicant	Prior to issuance of building permits.	City of Brea Engineering Department	

2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

Mitigation Measure		Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
PPP E-6 PPP-GHG-6	The California Air Resources Board's Renewable Portfolio Standard (RPS) is a foundational element of the State's emissions reduction plan. These mandates apply directly to investor-owned utilities, which in the case of the proposed project is Southern California Edison. On September 10, 2018, Senate Bill 100 was signed into law and established the following RPS targets: 50 percent renewable resources target by December 31, 2026, and 60 percent target by December 31, 2030. SB 100 also requires that retail sellers and local publicly owned electric utilities procure a minimum quantity of electricity products from eligible renewable energy resources so that the total kilowatt hours of those products sold to their retail end-use customers achieve 44 percent of retail sales by December 31, 2024; 52 percent by December 31, 2027; and 60 percent by December 31, 2030.	Not Applicable	Not Applicable	Not Applicable	Not Applicable
PPP GHG-7	On January 18, 2007, Governor Arnold Schwarzenegger issued Executive Order S-1-07 requiring the establishment of a Low Carbon Fuel Standard (LCFS) for transportation fuels. The LCFS was amended in 2011 and readopted in 2015. This statewide goal requires that California's transportation fuels reduce their carbon intensity by at least 10 percent by 2020.	Not Applicable	Not Applicable	Not Applicable	Not Applicable
PPP E-7 PPP GHG-8	The 2007 Energy Bill creates new federal requirements for increases in fleetwide fuel economy for passenger vehicles and light trucks under the Federal Corporate Average Fuel Economy Standards. The federal legislation requires a fleetwide average of 35 miles per gallon (mpg) to be achieved by 2020. The National Highway Traffic Safety Administration is directed to phase in requirements to achieve this goal. Analysis by the California Air Resources Board suggests that this will require an annual improvement of approximately 3.4 percent between 2008 and 2020. 2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

Mitigation Measure		Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
PPP GHG-9	On July 22, 2002, Governor Gray Davis signed Assembly Bill 1493 (Pavley) requiring CARB to develop and adopt regulations designed to reduce greenhouse gases emitted by passenger vehicles and light-duty trucks beginning with the 2009 model year. The standards set within the Pavley regulations are expected to reduce GHG emissions from California passenger vehicles by about 22 percent in 2012 and about 30 percent in 2016. California had petitioned the USEPA in December 2005 to allow these more stringent standards and California executive agencies have repeated their commitment to higher mileage standards. On July 1, 2009, the USEPA granted California a waiver that will enable the state to enforce stricter tailpipe emissions on new motor vehicles.	Not Applicable	Not Applicable	Not Applicable	Not Applicable
PPP E-8 PPP GHG-10	SB 375 requires the reduction of GHG emissions from light trucks and automobiles through land use and transportation efforts that will reduce vehicle miles traveled. In essence, SB 375's goal is to control GHGs by curbing urban sprawl and through better land use planning. SB 375 essentially becomes the land use contribution to the GHG reduction requirements of AB 32, California's global warming bill enacted in 2006, and SB 32. HAZARDS AND HAZARDOUS MATERIALS					
PPP HAZ-1	Any project-related hazardous materials and hazardous wastes will be transported to and/or from the project site in compliance with any applicable state and federal requirements, including the US Department of Transportation regulations listed in the Code of Federal Regulations (Title 49, Hazardous Materials Transportation Act); California Department of Transportation standards; and the California Occupational Safety and Health Administration standards.	Project Applicant and Project Construction Contractor	During construction and operations	City of Brea Engineering Department	

2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

	Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
PPP HAZ-2	Any project-related hazardous waste generation, transportation, treatment, storage, and disposal will be conducted in compliance with the Subtitle C of the Resource Conservation and Recovery Act (Code of Federal Regulations, Title 40, Part 263), including the management of nonhazardous solid wastes and underground tanks storing petroleum and other hazardous substances. The proposed project will be designed and constructed in accordance with the regulations of the Orange County Environmental Health Department, which is the designated Certified Unified Program Agency and which implements state and federal regulations for the following programs: (1) Hazardous Waste Generator Program, (2) Hazardous Materials Release Response Plans and Inventory Program, (3) California Accidental Release Prevention, (4) Aboveground Storage Tank Program, and (5) Underground Storage Tank Program.	Project Applicant and Project Construction Contractor	During construction and operations	City of Brea Engineering Department	
PPP HAZ-3	Any project-related demolition activities that have the potential to expose construction workers and/or the public to asbestos-containing materials or lead-based paint will be conducted in accordance with applicable regulations, including, but not limited to: - South Coast Air Quality Management District's Rule 1403 - California Health and Safety Code (Section 39650 et seq.) - California Code of Regulations (Title 8, Section 1529) - California Occupational Safety and Health Administration regulations (California Code of Regulations, Title 8, Section 1529 [Asbestos] and Section 1532.1 [Lead]) - Code of Federal Regulations (Title 40, Part 61 [asbestos], Title 40, Part 763 [asbestos], and Title 29, Part 1926 [asbestos and lead])	Project Applicant and Project Construction Contractor	During construction and operations	City of Brea Engineering Department	
PPP HAZ-4	The removal of other hazardous materials, such as polychlorinated biphenyls (PCBs), mercury-containing light ballast, and mold, will be completed in accordance with applicable regulations pursuant to 40 CFR 761 (PCBs), 40 CFR 273 (mercury-containing light ballast), and 29 CFR 1926 (molds) by workers with the hazardous waste operations and emergency response (HAZWOPER) training, as outlined in 29 CFR 1910.120 and 8 CCR 5192.	Project Applicant and Project Construction Contractor	During construction and operations	City of Brea Engineering Department	

2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

	Mitigation Measure	Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
PPP HAZ-5	Any project-related new construction, excavations, and/or new utility lines within 10 feet or crossing existing high-pressure pipelines, natural gas/petroleum pipelines, or electrical lines greater than 60,000 volts will be designed and constructed in accordance with the California Code of Regulations (Title 8, Section 1541).	Project Applicant and Project Construction Contractor	During construction	City of Brea Engineering Department	
PPP HAZ-6	As part of the project review process, the City of Brea Police Department may require approval of an Emergency Evacuation and Response Plan in the event of an emergency at Brea Mall to address emergency response and access. Additional design features to address the City of Brea Police Department's service standards will be incorporated as conditions of approval for the project.	Project Applicant and City of Brea Police Department	Prior to issuance of building permits	City of Brea Engineering Department	

2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

Mitigation Measure		Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
HAZ-1	Prior to issuance of grading permits, the project applicant shall prepare a soil management plan (SMP) to ensure safe and appropriate handling, transportation, offsite disposal, reporting, oversight, and protocols used during construction to protect the health and safety of workers and future residents. The SMP shall be submitted to the City prior to issuance of a grading permit. The plan shall establish methodology and procedures to perform additional testing during grading if unknown hazardous materials are encountered and prior to grading for the soil stockpile. If additional contamination is discovered during grading activities, grading within that area shall be temporarily halted and redirected around the area until the appropriate evaluation and follow-up remedial measures are implemented in accordance with the soil management plan so that the area is suitable for grading activities to resume. If hydrocarbon impacted soil is encountered soil samples shall be collected and analyzed for total petroleum hydrocarbons (TPH) by the Environmental Protection Agency (USEPA) Method 8015M and volatile organic compounds (VOCs) by EPA Method 8260B. TPH results shall be compared to Orange County Health Care Agency (OCHCA) TPH cleanup standards and VOCs shall be compared to screening levels as outlined in Department of Substances Control (DTSC) Human Health Risk Assessment Note No. 3 or EPA Regional Screening Levels (RSLs). Both DTSC and EPA RSLs are updated yearly and the most recent levels shall be used. If levels encountered are above the outlined screening levels, the OCHCA shall be notified. If, soil remediation and/or export of hazardous materials is required, soil remediation must be performed in accordance with the appropriate agency requirements (Regional Water Quality Control Board, DTSC, South Coast Air Quality Management District).	Project Applicant and geologist.	Prior to construction	City of Brea Planning Division	
LAND USE AND PLANNING					
PPP LU-1	As part of the project review process, the City of Brea is requiring that the Brea Mall prepare a parking management plan to address holiday traffic and parking during the peak holiday season. The requirement to prepare a submit a parking management plan for holiday traffic will be incorporated as conditions of approval for the project.	Project Applicant	Prior to issuance of building permits. During construction and operational activities	City of Brea Planning Division	

2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

Mitigation Measure		Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
NOISE					
PPP NOI-1	Project-related construction activity will be limited to the hours of 7:00 am to 7:00 pm on weekdays and Saturdays. Construction is prohibited on Sundays.	Project Applicant	During construction activities	City of Brea Engineering Department	
PPP NOI-2	The project will comply with City of Brea's stationary exterior noise standards summarized above in Table 5.8-3.	Project Applicant	During operation	City of Brea Engineering Department	
PPP NOI-3	The project will comply with the City of Brea's vibration standards of 70 VdB at the property line of the sensitive receptor.	Project Applicant	During operation	City of Brea Engineering Department	
PPP NOI-4	The residential development will comply with the California Building Code (CBC), Title 24, Part 2, Volume 1, Chapter 12, Interior Environment, Section 1207.11.2, Allowable Interior Noise Levels. Non-residential development will comply with the CBC, Title 24, Building Standards Administrative Code, Part 11, CALGreen.	Project Applicant	During operation	City of Brea Engineering Department	
PPP NOI-5	Outdoor nonresidential uses in mixed-use projects shall be prohibited from operating between the hours of 10:00 p.m. and 7:00 a.m. in accordance with Section 20.258.030 (H)(1) Hours of Operation.	Project Applicant	During operation	City of Brea Engineering Department	
PPP NOI-6	The covenants, conditions, and restrictions of a mixed-use project shall indicate the times when the loading and unloading of goods may occur on the street, provided that in no event shall loading or unloading take place after 10:00 p.m. or before 7:00 a.m. on any day of the week in accordance with Section 20.258.030 (H)(3) Loading and Unloading Activities.	Project Applicant	During operation	City of Brea Engineering Department	
PPP NOI-7	Residents of a mixed-use development project shall be notified in writing before taking up residence that they will be living in an urban type of environment and that the noise levels may be higher than a typical residential area. The covenants, conditions, and restrictions of a mixed-use project shall require that the residents acknowledge their receipt of the written noise notification. Their signatures shall confirm receipt and understanding of this information in accordance with Section 20.258.030 (H)(4) Noise Notification.	Project Applicant	Prior to issuance of an occupancy permit. During leasing.	City of Brea Engineering Department and Project Applicant	

2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

Mitigation Measure		Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
PPP NOI-8	Residential dwelling units shall be designed to be sound attenuated against present and future project noise. New projects or new nonresidential uses in existing projects shall provide an acoustical analysis report, by an acoustical engineer, describing the acoustical design features of the structure required to satisfy the exterior and interior noise standards in accordance with Section 20.258.030 (H)(6) Sound Mitigation.	Project Applicant	Prior to issuance of a building permit	City of Brea Engineering Department	
PPP NOI-9	Noise-generating equipment. Noise-generating equipment (e.g., refrigeration units, air conditioning, exhaust fans, etc.) shall require special consideration in their location and screening in order to avoid creating a nuisance in accordance with Section 20.258.030 (K)(3) Noise Generating Equipment.	Project Applicant	Prior to issuance of a building permit and during operation	City of Brea Engineering Department	
POPULATION AND HOUSING					
No Mitigation Measures or Plans, Programs, and Policies are applicable.					
PUBLIC SERVICES					
PPP PS-1	New buildings are required to meet the fire regulations outlined in California Health and Safety Code (Sections 13000 et seq.).	Project Applicant	Prior to issuance of a building permit.	City of Brea Engineering Department	
PPP PS-2	The project applicant is required to pay development impact fees (dispatch impact fees, fire impact fees, fire service fees).	Project Applicant	Prior to issuance of a building permit.	City of Brea Planning Division	
PPP PS-3	As part of the project review process, the City of Brea Fire Department will require approval of Building Plan Check for Site Plan and Emergency Access as well as approval of Fire Master Plan. Additional design features to address the City of Brea Fire Department's requirements will be incorporated as conditions of approval for the project.	Project Applicant	Prior to issuance of a building permit	City of Brea Fire Department	
PPP PS-4	The project will be designed, built, and operated in accordance with the City of Brea's Municipal Code Chapter 15.08 Building Code and Chapter 16.04 Brea Fire Code.	Project Applicant	Prior to issuance of a building permit	City of Brea Engineering Department	

2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

Mitigation Measure		Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
PPP PS-5	The project applicant is required to pay dispatch impact fees.	Project Applicant	Prior to issuance of a building permit	City of Brea Planning Division	
	As part of the project review process, the City of Brea Police Department may require project design features to improve security. Additional design features to address the City of Brea Police Department's service standards will be incorporated as conditions of approval for the project, such as: - Increased integration with onsite private security and the police department - The ability of police officers to access locked common areas for emergency response - Verified police/fire radio reception in enclosed areas of the mall. - Installation of cameras on traffic signals.	Project Applicant	Prior to issuance of a building permit	City of Brea Police Department	
PPP PS-6	Pursuant to AB 2926, new development is required to pay development impact fees to assist in providing school facilities to serve students generated by new development.	Project Applicant	Prior to issuance of a building permit	City of Brea Planning Division	
PPP PS-7	Pursuant to SB 50, new development is required to offset the costs associated with increasing school capacity, where the funds collected go to acquiring school sites, constructing new school facilities, and modernizing existing school facilities.	Project Applicant	Prior to issuance of a building permit	City of Brea Planning Division	
PPP PS-8	The proposed project is required to comply with Brea Municipal Code Section 18.64.080 that establishes the subdivision regulations for the provision of park and recreational facilities through land dedication, installation of improvements, payment of in-lieu fee thereof, or a combination. Where applicable, new development is required to fund park development and improvements through the payment of park development fees.	Project Applicant	Prior to issuance of a building permit	City of Brea Engineering Department	
RECREATION					
PPP REC-1	New development is required to fund park and recreational development and improvements through the payment of park development fees.	Project Applicant	Prior to issuance of a building permit	City of Brea Planning Division	

2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

Mitigation Measure		Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
PPP REC-2	The proposed project includes installation of Class II bike lanes and/or sharrow bike lanes on the "ring road" and the signalized entries of the Brea Mall. The requirement to improve bicycle and pedestrian connections will be incorporated as conditions of approval for the project.	Project Applicant	Prior to issuance of an occupancy permit	City of Brea Engineering Department	
TRANSPORTATION					
PPP TRAF-1	The proposed project is required to pay development impact fees to the City of Brea pursuant to the City's AB 1600 Transportation Improvement Nexus Program (Ordinance 966). Based on a transportation improvement nexus program study conducted in 2011, the City Council adopted Resolution 2011-096, which updated the impact fees, effective February 4, 2012. Fair-share fees serve to offset or mitigate the cumulative traffic impacts caused by new development. The program ensures all future development in the City of Brea contributes on a fair-share basis.	Project Applicant	Prior to issuance of a building permit	City of Brea Planning Division	
PPP TRAF-2	Modifications to the roadway network, including driveways, curbs, and sidewalks, are subject to approval by the City of Brea. Construction work within the right-of-way of a public roadway requires the issuance of a permit by the City of Brea.	Project Applicant	Prior to issuance of a building permit	City of Brea Engineering Department	
PPP TRAF-3	As part of the project review process, the City of Brea is requiring that the Brea Mall prepare a parking management plan for construction and operational activities to address holiday traffic and parking during the peak holiday season. The requirement to prepare a submit a parking management plan for holiday traffic will be incorporated as conditions of approval for the project	Project Applicant in coordination with the City of Brea Police Department	Prior to issuance of an occupancy permit	City of Brea Engineering Department and City of Brea Police Department	
PPP TRAF-4	The proposed project includes installation of Class II bike lanes and/or sharrow bike lanes on the "ring road" and the signalized entries of the Brea Mall. The requirement to improve bicycle and pedestrian connections will be incorporated as conditions of approval for the project.	Project Applicant	Prior to issuance of an occupancy permit	City of Brea Engineering Department	

2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

Mitigation Measure		Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
TRAF-1	Prior to issuance of a building permit, the City and Caltrans shall jointly identify feasible operational and physical improvements and the associated fair-share funding contribution necessary to mitigate project-related direct and indirect impacts to state transportation facilities, including these intersections: #16 Harbor Boulevard at Imperial Highway, #18 Brea Boulevard at Imperial Highway, #19 Randolph Avenue at Imperial Highway, #20 State College Boulevard at Imperial Highway, #22 SR-57 NB Ramps at Imperial Highway, and #23 Associated Road at Imperial Highway.	City of Brea Engineering Department, Caltrans, Project Applicant	Prior to issuance of a building permit	City of Brea Engineering Department, Caltrans	
TRIBAL CULTURAL RESOURCES					
PPP TCR-1	Pursuant to California Health and Safety Code Section 7050.5, if human remains are discovered in the project site, disturbance of the site shall halt and remain halted until the coroner has conducted an investigation. If the coroner determines that the remains are not subject to his or her authority and has reason to believe that they are those of a Native American, he or she shall contact, by telephone within 24 hours, the NAHC.	Tribal Monitor, Qualified Archaeologist, and Project Applicant	During site-grading activities	City of Brea Planning Division, Project Applicant	
TCR-1	If the professional archaeologist implementing Mitigation Measure CUL-1 believes that a cultural resource encountered onsite is of Native American origin, the archaeologist shall notify representatives of Native American tribes with traditional territories in the project region. If requested by the Native American tribe(s), the developer or archaeologist on call shall, in good faith, consult on the discovery and its disposition (e.g., avoidance, preservation, return of artifacts to tribe). If the resources are Native American in origin, a tribal monitor from the consulting tribe shall be present during the remaining site-grading activities.	Tribal Monitor, Qualified Archaeologist, and Project Applicant	During site-grading activities	City of Brea Planning Division, Project Applicant	
TCR-2	During construction activities, the project applicant shall allow archaeological monitors of Native American tribes to access the project site on a volunteer basis to monitor grading and excavation activities.	Archaeological Monitors of Native American Tribes and Project Applicant	During construction activities (grading and excavation activities)	Project Applicant	

2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

Mitigation Measure		Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
UTILITIES AND SERVICE SYSTEMS					
PPP USS-1	The project will pay the Sanitary Sewer Connection Fees collected by the City of Brea, which contribute to maintenance and installation of sewer improvements in the OCSD in accordance with Section 3.32.040, Sewer Service Fees and Charges, of the Brea Municipal Code.	Project Applicant	Prior to issuance of a building permit	City of Brea Planning Division	
PPP USS-2	As part of the project review process, the City of Brea Engineering Department will require approval of a Final Sewer Study as part of the encroachment permit issuance. The City of Brea Engineering Department will require project design features to address sewer deficiencies within the Brea Mall and within the City's right-of-way on State College Boulevard. Additional design features to address the City of Engineer's requirements will be incorporated as conditions of approval for the project.	Project Applicant	Prior to issuance of an encroachment permit and during construction	City of Brea Engineering Department	
PPP USS-3	The project will pay the water impact fees and water connection fees collected by the City of Brea, which cover costs to purchase water supplies and to operate and maintain the water distribution system in accordance with Ordinance 967.	Project Applicant	Prior to issuance of a building permit	City of Brea Planning Division	
PPP USS-4	Landscaping installed onsite shall conform to the California Green Building Standards Code and Water Efficient Landscape Ordinance requirements to increase landscape water efficiency.	Project Applicant	Prior to issuance of a building permit and during construction	City of Brea Engineering Department	
PPP USS-5	Plumbing fixtures installed onsite shall conform to California Green Building Standards Code requirements to increase water efficiency and reduce urban per capita water demand.	Project Applicant	Prior to issuance of a building permit and during construction	City of Brea Engineering Department	
PPP USS-6	The project would comply with the City's water conservation program during a drought or emergency situation, in accordance with Chapter 13.20, Water Management Program, of the City's Municipal Code.	Project Applicant	Prior to issuance of a building permit and during construction	City of Brea Engineering Department	

2. Mitigation Monitoring Requirements

Table 2 Mitigation Monitoring Requirements

Mitigation Measure		Responsibility for Implementation	Timing	Responsibility for Monitoring	Monitor (Signature Required) (Date of Compliance)
PPP USS-7	The project will be constructed and operated in accordance with the Santa Ana Regional Water Quality Control Board Municipal Stormwater (MS4) Permit for Orange County. The MS4 Permit requires the proposed project to prepare and implement a WQMP to: - Control release of contaminants into storm drain systems. - Educate the public about stormwater impacts. - Detect and eliminate illicit discharges. - Control runoff from construction sites. - Implement BMPs and site-specific runoff controls and treatments.	Project Applicant	Prior to issuance of a building permit and during construction	City of Brea Engineering Department	
PPP USS-8	California's Green Building Standards Code (CALGreen) requires the recycling and/or salvaging for reuse a minimum of 65 percent of the nonhazardous construction and demolition waste generated during most "new construction" projects (CALGreen Sections 4.408 and 5.408). Construction contractors are required to submit a construction waste management plan that identifies the construction and demolition waste materials to be diverted from disposal by recycling, reuse on the project, or salvage for future use or sale and the amount (by weight or volume).	Project Applicant	Prior to issuance of a building permit and during construction	City of Brea Engineering Department	
PPP USS-9	The project will abide by AB 341 and AB 1826. The project will store and collect recyclable materials in compliance with AB 341. Green waste will be handled in accordance with AB 1826.	Project Applicant	Prior to issuance of a building permit and during construction	City of Brea Engineering Department
